### Description

The KOBOLD flow meters DOG-4/-6 are used for flow measurement of gases.

Primary use of DOG-4 is for dry gases.

The DOG-6 comes with a special sensor construction and an inclined measuring head. This inclination optimises the condensate drain specifically for applications involving wet gases, e.g. biogas.

The medium flows through an orifice in a tube. Bypass bores are located at the sides. The dynamic pressure at the orifice causes part of the gas volumetric flow to flow into the bypass. The division ratio remains constant over the whole measuring range.

The bypass channel contains the Oscillator – the Measuring cell itself. When the gas flows through the measuring cell, a gas column oscillates in a U-shaped channel mounted to the left and right. This oscillation frequency is proportional to the flow velocity and thus to the total volume flow. The oscillation frequency is sensed with a platinum sensor. An electrical alternating signal is generated that is displayed in the series connected electronics.

### Application

The inner, connected flow channels are generously dimensioned. The constant changes of direction of the flow in the channels have a self-cleaning effect. The devices are therefore extremely dirt resistant and have no consumables. The mounting position can be chosen at will. When condensate forms in the gas, the horizontal mounting position with the sensing element pointing upwards is recommended. The gas flow velocity anywhere in the pipework upstream of the flow meter should not exceed the sound velocity. Pressure drops above critical and pulsating streams must be avoided.

The recommended inlet pipe section is 10x DN and the outlet pipe section 5x DN.

The version available with the bypass ball valves installed between the measuring head and the housing enables easy sensor replacement and/ or measuring head cleaning without flow interruption in main line/ flow meter. The bypass valves also serve for sensor protection against mechanical damage during start-up.

### Areas of Application

- Compressed air
- Natural gas, biogas, fermentation gas
- Propane
- Hydrogen gas

**Pressure Loss/Flow**

The diagram applies for gases with a density of air at NPT (0°C and 1013.25 mbar). The pressure loss is always proportional to the density of the gas. For example, the pressure loss doubles at 100% higher operating pressure.

**Calculating the Actual Density**

The actual density can be calculated with the following formula:

$$D = \frac{D_0 \cdot P \cdot T_0}{T}$$

$D_0$  = density at 1 bar abs. and 0°C (= 273 K)

$T$  = temperature in K

(= °C + 273 for example 20°C = 273 + 20 = 293 K)

$T_0$  = 273 K

$P$  = operating pressure in bar (absolute pressure)

**Calculating the Norm Flow**

$$Q_N = Q \cdot \frac{P \cdot 273}{1.013 \cdot T}$$

$Q_N$  = norm flow at 1.013 bar abs. and 0°C

$Q$  = operating flow

$P$  = operating pressure in bar (absolute pressure)

$T$  = operating temperature in K
