1 - INSTRUMENT DESCRIPTION

1.1 - GENERAL DESCRIPTION

TLK 35 is a "single loop" digital microprocessor-based controller, with ON/OFF, Neutral Zone ON/OFF, PID single action, PID dual action (direct and reverse) control and with AUTO-TUNING FAST function, SELF-TUNING function and automatic calculation of the FUZZY OVERSHOOT CONTROL parameter for PID control.

The PID control has a particular algorithm with TWO DEGREES OF **FREEDOM** that optimises the instrument's features independently This manual contains the information necessary for the product to in the event of process disturbance and Set Point variations.

> serial communication using MODBUS-RTU communication protocol and a transmission speed up to 38.400 baud.

> The process value is visualized on 4 red displays, while the output

The instrument is equipped with a 3 LED programmable shift

The instrument provides for the storage of 4 Set Points and can This document is the exclusive property of TECNOLOGIC S.p.A. have up to 3 outputs: relay type or can drive solid state relays type

Depending on the model required the input accept:

TECNOLOGIC S.p.A. reserves the right to make any formal or c: Thermocouples temperature probes (J,K,S and TECNOLOGIC IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), Thermoresistances PT100.

E: Thermocouples temperature probes (J,K,S and TECNOLOGIC is pressed for approx. 15 seconds, the display will return to normal IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), functioning automatically. Thermistors PTC and NTC.

I: normalized analogue signals 0/4..20 mA

V: normalized analogue signals 0..1 V, 0/1..5 V, 0/2..10 V

Other important available functions are: Loop-Break Alarm function, By pushing key "P" and holding it down for approx. 2 sec. it is reaching of the Set Point at controlled speed, ramp and dwell possible to enter into the main selection menu. function, Soft-Start function, protection compressor function for Using the "UP" or DOWN" keys, it is then possible to roll over the neutral zone control, parameters protection on different levels.

1.2 - FRONT PANEL DESCRIPTION

- 1 Key P: This is used to access the programming parameters and to confirm selection.
- 2 Key DOWN: This is used to decrease the values to be set and to select the parameters. If the key is held down, the user returns to the previous programming level until he exits the programming
- 3 Key UP: This is used to increase the values to be set and to select the parameters. If the key is held down, the user returns to the previous programming level until he exits the programming mode. Outside the programming mode it permits visualisation of the output control power.
- 4 Key U: This is a key with a function programmable by par. "USrb". It can be set to: Activate Auto-tuning and Self-tuning functions, swap the instrument to manual control, silence the alarm, change the active Set Point, deactivate control (see par. 4.12) and modify the visibility of the parameters in "ConF" menu (see par. 2.3).

5 - Led OUT1: indicates the state of output OUT1

6 - Led OUT2: indicates the state of output OUT2

7 - Led OUT3: indicates the state of output OUT3

- 8 Led SET : It indicates access to the programming mode and parameter programming level.
- 9 Led AT/ST: indicates that the Self-tuning function is activated (light on) or that Auto-tuning (flashing) is in progress.
- 10 Led Shift index: indicates that the process value is lower than the one programmed on par. "AdE".
- 11 Led = Shift index: indicates that the process value is within the range [SP+AdE ... SP-AdE]
- 12 Led + Shift index: indicates that the process value is higher than the one set on par. "AdE".

2 - PROGRAMMING

2.1 - FAST PROGRAMMING OF THE SET POINT

This procedure permits rapid programming of the active Set Point and possibly the alarm thresholds (see par 2.3)

Push key "P", then release it and the display will visualise "SP n" (where n is the number of the Set Point active at that moment) alternatively to the programmed value.

To modify the value, press "UP" key to increase it or the "DOWN" key to decrease it.

These keys change the value one digit at a time but if they are pressed for more than one second, the value increases or decreases rapidly and, after two seconds in the same condition, the changing speed increases in order to allow the desired value to be reached rapidly.

Once the desired value has been reached, by pushing key P it is possible to exit by the fast programming mode or it is possible to visualised by pushing the "P" key. visualise the alarm thresholds (see par. 2.3).

To exit the fast Set programming it is necessary to push key P, after the visualisation of the last Set Point, or alternatively, if no key

2.2 - SELECTION OF THE CONTROL STATE AND PARAMETER **PROGRAMMING**

selections:

"OPEr"	to enter into the operating parameters menu	
"ConF"	to enter into the configuration parameters menu	
"OFF"	to swap the regulator into the OFF state	
"rEG"	to swap the regulator into the automatic control state	
"tunE"	to activate the Auto-tuning or Self-tuning function	
"OPLO"	to swap the regulator to the manual control state and	
	therefore to program the % control value using the	
	"UP" and "DOWN" keys	

Once the desired item has been selected, push key "P" to confirm. Selecting "OPEr" and "ConF" gives the possibility of accessing other menus containing additional parameters and more precisely:

"OPEr" - Operating parameters Menu: this normally contains the Set Point parameters but it can contain all the desired parameters (see par. 2.3).

"ConF" - Configuration parameters Menu: this contains all the operating parameters and the functioning configuration parameters (alarm configuration, control, input, etc.)

To enter the menu "ConF" select the option "ConF", press the key "P" and the display will show "0".

At this request, enter, using keys "UP" and "DOWN", the number reported on the last page of this manual and push key "P".

If an incorrect password is entered, the instrument exit from programming mode.

If the password is correct, the display will visualise the code identifying the first group of parameters (" ISP ") and with keys "UP" and "DOWN" it will be possible to select the desired group of parameters.

Once the desired group of parameters has been selected, the code identifying the first parameter of the selected group will be

Again using the "UP" and "DOWN" keys, it is possible to select the desired parameter and, if the key "P" is pressed, the display will

alternatively show the parameter's code and its programming value, to pass from "rEG" state to the state programmed on the parameter which can be modified by using the "UP" or "DOWN" keys.

Once the desired value has been programmed, push key "P" once - By using the digital input 1 suitably programming par. "diF" ("diF" only the code of the selected parameter.

new parameter (if present) and modify it as described above.

key pressed for approx. 2 sec., afterwards the display will return to state it was in when it was last switched off. visualise the code of the group of parameters.

Release the key and by using the "UP" and "DOWN" keys, it will be functioning state of the controller. possible to select a new group.

To exit the programming mode, no key should be pressed for on the display by pushing key "UP". approx. 20 seconds, or keep the "UP" or "DOWN" pressed until exit The range of the power values goes from H100 (100% of the output from the programming mode is obtained.

The programming and exit modes for the "OPEr" menu are the direct action). same as those described for menu "ConF" with the difference that CONTROL OFF (OFF) - The instrument can be swapped into the to access the menù "OPEr" the Password is not required.

ATTENTION: The instrument is programmed in factory with all the parameters, to exception of the Set Point "SP1" (and 2,3,4), programmable in the menù "ConF" to the purpose to prevent wrong accidental programming from non experienced consumers.

2.3 - PARAMETERS PROGRAMMING LEVELS

The menu "OPEr" normally contains the parameters used to program the Set Point; however it is possible to make all desired parameters appear or disappear on this level, by following this procedure:

Enter the menu "ConF" and select the parameter to be made programmable or not programmable in the menu "OPEr".

Once the parameter has been selected, if the LED SET is switched has been programmed. off, this means that the parameter is programmable only in the menu "ConF", if instead the LED is on, this means that the the maximum number of Set Points selected on par. "nSP" and they parameter is also programmable in the menu "OPEr".

SET will change its state indicating the parameter accessibility level (on = menu "OPEr" and "ConF"; off = menu "ConF" only).

The active Set Point and the alarm thresholds will only be visible on the Set Point fast programming level (described in par. 2.1) if the selected as active. relative parameters are programmed to be visible (i.e. if they are present in the menu "OPEr").

The possible modification of these Sets, with the procedure described in par. 2.1, is instead subordinate to what is programmed in par. "Edit" (contained in the group " PAn ").

This parameter can be programmed as:

=SE: The active Set Point can be modified while the alarm thresholds cannot be modified.

=AE: The active Set Point cannot be modified while the alarm thresholds can be modified

=SAE: Both the active Set Point and the alarm thresholds can be necessary protective measures. modified

=SAnE : Both the active Set Point and the alarm thresholds cannot be modified

2.4 - CONTROL STATES

control off (OFF) and manual control (OPLO).

The instrument is able to pass from one state to the other:

- by selecting the desired state from the main selection menu suing the keyboard.
- "USrb" ("USrb" = tunE; "USrb" = OPLO; "USrb" = OFF) it is possible on DIN OMEGA rail.

- and vice versa.
- more: the new value will be memorised and the display will show = = OFF) it is possible to pass from "rEG" state to the state OFF and vice versa.
- By using the "UP" or "DOWN" keys, it is then possible to select a Automatically (the instrument swaps into "rEG" state at the and of the auto-tuning execution)

To select another group of parameters, keep the "UP" or "DOWN" When switched on, the instrument automatically reassumes the

AUTOMATIC CONTROL (rEG) – Automatic control is the normal

During automatic control it is possible to visualize the control power

power with reverse action) to C100 (100% of the output power with

"OFF" state, i.e. the control and the relative outputs are deactivated.

The alarm outputs are instead working normally.

BUMPLESS MANUAL CONTROL (OPLO) - By means of this option it is possible to manually program the power percentage given as output by the controller by deactivating automatic control. When the instrument is swapped to manual control, the power percentage is the same as the last one supplied and can be

As in the case of automatic control, the programmable values range from H100 (+100%) to C100 (-100%).

To return to automatic control, select "rEG" in the selection menu.

2.5 - ACTIVE SET POINT SELECTION

modified using the "UP" and "DOWN" keys.

This instrument permits pre-programming of up to 4 different Set points ("SP1", "SP2", "SP3", "SP4") and then selection of which one must be active. The maximum number of Set points is determined by the par. "nSP" located in the group of parameters " ISP ".

The active Set point can be selected:

- by parameter "SPAt" in the group of parameters " 'SP ".
 by key "U" if par. "USrb" = CHSP
- by the digital inputs if diF" = CHSP, = SP1.2, =SP1.4 or = HE.Co
- Automatically between SP1 and SP2 if a time "dur.t" (see par. 4.8)

Set Points "SP1", "SP2", "SP3", "SP4" will be visible depending on can be programmed with a value that is between the value To modify the visibility of the parameter, push key "U": the LED programmed on par. "SPLL" and the one programmed on par. "SPHL".

> Note: in all the following examples the Set point is indicated as "SP", however the instrument will act according to the Set point

3 - INFORMATION ON INSTALLATION AND USE

3.1 - PERMITTED USE

The instrument has been projected manufactured as a measuring and control device to be used according to EN61010-1 for the altitudes operation until 2000 ms.

The use of the instrument for applications not expressly permitted by the above mentioned rule must adopt all the

The instrument CANNOT be used in dangerous environments (flammable or explosive) without adequate protection.

The installer must ensure that EMC rules are respected, also after the instrument installation, if necessary using proper filters.

Whenever a failure or a malfunction of the device may cause The controller can act in 3 different ways: automatic control (rEG), dangerous situations for persons, thing or animals, please remember that the plant has to be equipped with additional devices which will guarantee safety.

3.2 - MECHANICAL MOUNTING

- By using the key "U" on the keyboard; suitably programming par. The instrument, in case 4 DIN Modules, is designed for mounting

Avoid placing the instrument in environments with very high 4-FUNCTIONS humidity levels or dirt that may create condensation or introduction of conductive substances into the instrument.

Ensure adequate ventilation to the instrument and avoid installation All the parameters referring measurements are contained in the in containers that house devices which may overheat or which may group "InP". cause the instrument to function at a higher temperature than the one permitted and declared.

Connect the instrument as far away as possible from sources of electromagnetic disturbances such as motors, power relays, relays, solenoid valves, etc.

3.3 - ELECTRICAL CONNECTION

Carry out the electrical wiring by connecting only one wire to each terminal, according to the following diagram, checking that the \mathbf{V} : normalized analogue signals 0..1 V, 0/1..5 V, 0/2..10 V power supply is the same as that indicated on the instrument and that the load current absorption is no higher than the maximum electricity current permitted.

As the instrument is built-in equipment with permanent connection inside housing, it is not equipped with either switches or internal devices to protect against overload of current: the installation will include an overload protection and a two-phase circuit-breaker, placed as near as possible to the instrument, and located in a position that can easily be reached by the user and marked as instrument disconnecting device which interrupts the power supply to the equipment.

It is also recommended that the supply of all the electrical circuits connected to the instrument must be protect properly, using devices (ex. fuses) proportionate to the circulating currents.

It is strongly recommended that cables with proper insulation, according to the working voltages and temperatures, be used.

Furthermore, the input cable of the probe has to be kept separate from line voltage wiring. If the input cable of the probe is screened, it has to be connected to the ground with only one side.

We recommend that a check should be made that the parameters are those desired and that the application functions correctly before connecting the outputs to the actuators so as to avoid on par. "dP" (0=1; 1=0,1; 2=0,01; 3=0,001) and then, on par. malfunctioning that may cause irregularities in the plant that could cause damage to people, things or animals.

Tecnologic S.p.A. and its legal representatives do not assume of the scale (20 mA, 50 mV, 60 mV, 5 V or 10 V). any responsibility for any damage to people, things or animals deriving from violation, wrong or improper use or in any case used to recalibrate the instrument according to application needs, not in compliance with the instrument's features.

3.4 - ELECTRICAL WIRING DIAGRAM

4.1 - MEASURING AND VISUALIZATION

Depending on the model required the input accept:

C: Thermocouples temperature probes (J,K,S and TECNOLOGIC IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), Thermoresistances PT100.

E: Thermocouples temperature probes (J,K,S and TECNOLOGIC IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), Thermistors PTC and NTC.

I: normalized analogue signals 0/4..20 mA

Depending on the model, using par. "SEnS", it's possible to select the type of input probe, which can be:

- for thermocouples J (J), K (CrAL), S (S) or for infrared sensors serie TECNOLOGIC IRTC1 with linearization J (Ir.J) or K (Ir.CA)
- for thermoresistances Pt100 IEC (Pt1) or thermistors PTC KTY81-121 (Ptc) or NTC 103AT-2 (ntc)
- for normalised signals in current 0..20 mA (0.20) or 4..20 mA (4.20)
- for normalised signals in tension 0..1 V (0.1), 0..5 V (0.5), 1..5 V (1.5), 0..10 V (0.10) or 2..10 V (2.10).
- for normalised signals in tension 0..50 mV (0.50), 0..60 mV (0.60), 12..60 mV (12.60).

We recommend to switch on and off the instrument when these parameters are modified, in order to obtain a correct measuring.

For the instruments with input for temperature probes (tc, rtd) it's possible to select, through par. "Unit", the unit of measurement (°C, °F) and, through par. "dP" (Pt100, PTC and NTC only) the desired resolution (0=1°; 1=0,1°).

Instead, with regards to the instruments with normalised analogue input signals, it is first necessary to program the desired resolution "SSC", the value that the instrument must visualise at the beginning of the scale (0/4 mA, 0/12 mV, 0/1 V o 0/2 V) and, on par. "FSC", the value that the instrument must visualise at the end

The instrument allows for measuring calibration, which may be by using par. "OFSt" and "rot".

Programming par. "rot"=1,000, in par. "OFSt" it is possible to set a positive or negative offset that is simply added to the value read by the probe before visualisation, which remains constant for all the measurements.

If instead, it is desired that the offset set should not be constant for all the measurements, it is possible to operate the calibration on

In this case, in order to decide which values to program on par. "OFSt" and "rot", the following formulae must be applied:

"rot" = (D2-D1) / (M2-M1)"OFSt" = D2 - ("rot" \times M2) where:

M1 =measured value 1

D1 = visualisation value when the instrument measures M1

M2 =measured value 2

D2 = visualisation value when the instrument measures M2 It then follows that the instrument will visualise:

DV = MV x "rot" + "OFSt"

where: DV = visualised value MV= measured value

Example 1: It is desired that the instrument visualises the value effectively measured at 20° but that, at 200°, it visualises a value lower than 10° (190°).

Therefore: M1=20; D1=20; M2=200; D2=190

"rot" = (190 - 20) / (200 - 20) = 0,944

"OFSt" = 190 - (0,944 x 200) = 1,2

Example 2: It is desired that the instrument visualises 10° whilst the value actually measured is 0°, but, at 500° it visualises a 50° higher value (550°).

Therefore: M1=0; D1=10; M2=500; D2=550

"rot" = (550 - 10) / (500 - 0) = 1,08

"OFSt" = $550 - (1.08 \times 500) = 10$

By using par. "FiL" it is possible to program time constant of the software filter for the input value measured, in order to reduce noise sensitivity (increasing the time of reading).

In case of measurement error, the instrument supplies the power as programmed on par. "OPE".

This power will be calculated according to cycle time programmed for the PID controller, while for the ON/OFF controllers the cycle time is automatically considered to be equal to 20 sec. (e.g. In the event of probe error with ON/OFF control and "OPE"=50, the control output will be activated for 10 sec., then it will be deactivated for 10 sec. and so on until the measurement error remains.).

By using par. "InE" it is also possible to decide the conditions of the input error, allowing the instrument to give the power programmed on par. "OPE" as output.

The possibilities of par. "InE" are:

- = Or : the condition occurs in case of over-range or probe breakage = Ur : the condition occurs in case of under-range or probe breakage
- = Our : the condition occurs in case of over-range or under-range or probe breakage

Using par. "diSP", located in the group "PAn", it is possible to set normal visualization of the display which can be the process variable (dEF), the control power (Pou), the active Set Point (SP.F) the Set Point operating when there are active ramps (SP.o) or alarm threshold AL1, AL2 or AL3 (AL1, AL2, AL3).

Again in the group "PAn" the par. "AdE" is present that defines the 3 led shift index functioning.

The lighting up of the green led = indicates that the process value is within the range [SP+AdE ... SP-AdE], the lighting up of the led indicates that the process value is lower than [SP-AdE] and the lighting up of the led + indicates that the process value is higher than [SP+AdE].

4.2 - OUTPUTS CONFIGURATION

The instrument's outputs can be programmed by entering the group of parameters "Out, where the relative parameters "O1F", "O2F" and "O3F" (depending on the number of outputs available on the instrument) are located.

The outputs can be set for the following functions:

- Main control output (1.rEG)
- Secondary control output (2.rEG)
- Alarm output normally open (ALno)
- Alarm output normally closed (ALnc)
- Alarm output normally closed with led reverse indication (ALni)
- Output deactivated (OFF)

The coupling outputs number outputs - number alarms can be made in the group referring to the alarm to the alarm ("IAL1", "IAL2", "JAL3").

4.3 - ON/OFF CONTROL (1rEG)

All the parameters referring to the ON/OFF control are contained in the group "1rEG".

This type of control can be obtained by programming par. "Cont" = On.FS or = On.FA and works on the output programmed as 1.rEG, The protection is a "delayed after deactivation" type. depending on the measure, on the active Set Point "SP", on the functioning mode "Func" and on the hysteresis "HSEt".

The instrument carries out an ON/OFF control with symmetric activation will occurs only after the elapsing of time "CPdt". hysteresis if "Cont" = On.FS or with asymmetrical hysteresis if The time programmed on parameter "CPdt" is counted starting from "Cont" = On.Fa.

The control works in the following way : in the case of reverse action, or heating ("FunC"=HEAt), it deactivates the output, when the process value reaches [SP + HSEt] in case of symmetrical hysteresis, or [SP] in case of asymmetrical hysteresis and is then The function is not active programming "CPdt" =OFF. activated again when the process value goes below value [SP -HSEt].

Vice versa, in case of direct action or cooling ("Func"=CooL), it deactivates the output, when the process value reaches [SP -HSEt] in case of symmetrical hysteresis, or [SP] in case of All the parameters referring to PID control are contained in the asymmetrical hysteresis and is activated again when the process value goes above value [SP + HSEt].

4.4 - NEUTRAL ZONE ON/OFF CONTROL (1rEG - 2rEG)

All the parameters referring to Neutral Zone ON/OFF control are contained in the group "IrEG".

This type of control can be obtained when 2 outputs are programmed respectively as 1.rEG and 2.rEG and the par. "Cont"

The Neutral Zone control is used to control plants in which there is an element which causes a positive increase (ex. Heater, humidifier, etc.) and an element which causes a negative increase (ex. Cooler, de-humidifier, etc).

The control functions works on the programmed outputs depending on the measurement, on the active Set Point "SP" and on the hysteresis "HSEt".

The control works in the following way: it deactivates the outputs when the process value reaches the Set Point and it activates the output 1.rEG when the process value goes below value [SP -HSEt], or it activates the output 2.rEG when the process value goes above [SP + HSEt].

Consequently, the element causing a positive increase has to be connected to the output programmed as 1.rEG while the element causing a negative increase has to be connected to the output programmed as 2.rEG.

If 2.rEG output is used to control compressor is possible to use the "Compressor Protection" function that has the meaning to avoid compressor "short cycles".

This function allows a control by time on the output 2.rEG activation, independently by the temperature control request.

This protection permits to avoid the output activation for a time programmable on par. "CPdt" (expressed in sec.); the output

the last output deactivation.

Obviously, whether during the time delay caused by the compressor protection function, the regulator request should stop, the output activation foreseen after time "CPdt" would be erased.

The led relative to 2.rEG output blinks during the phases of output activation delay, caused by "Compressor Protection" function.

4.5 - SINGLE ACTION PID CONTROL (1rEG)

group "1rEG".

The Single Action PID control can be obtained by programming par."Cont" = Pid and works on the output 1.rEG depending on the

active Set Point "SP", on the functioning mode "Func" and on the "Int" - Integral Time instrument's PID algorithm with two degree of freedom.

In order to obtain good stability of the process variable, in the event automatic tuning of the PID controller. of fast processes, the cycle time "tcr1" has to have a low value with The AUTO-TUNING function permits the calculation of thePID a very frequent intervention of the control output.

In this case use of a solid state relay (SSR) is recommended for driving the actuator.

The Single Action PID control algorithm foresees the setting of the following parameters:

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1.rEG

"Int" - Integral Time

"rS" - Manual Reset (if "Int =0 only)

"dEr" - Derivative Time

"FuOC" - Fuzzy Overshoot Control

This last parameter allows the variable overshoots at the start up of "FuOC" - Fuzzy Overshoot Control the process or at the changing of the Set Point to be avoided.

Please remember that a low value on this parameter reduces the overshoot while a high value increase it.

- 1: Value "FuOC" OK
- 2: Value "FuOC" too high
- 3: Value "FuOC" too low

4.6 - DOUBLE ACTION PID CONTROL (1rEG - 2rEG)

All the parameters referring to PID control are contained in the group "irEG".

The Double Action PID control is used to control plants where there is an element which causes a positive increase (ex. Heating) and an element which causes a negative increase (ex. Cooling).

This type of control can be obtained when 2 outputs are programmed respectively as 1.rEG and 2.rEG and the par. "Cont" = Pid.

The element causing a positive increase has to be connected to the output programmed as 1.rEG while the element causing a negative value is lower (with "Func" =HEAt) than [SP- |SP/5|] or higher (with increase has to be connected to the output programmed as 2.rEG.

The Double Action PID control works on the outputs 1.rEG and 2.rEG depending on the active Set Point "SP" and on the instrument's PID algorithm with two degrees of freedom.

In order to obtain good stability of the process variable, in case of fast processes, the cycle times "tcr1" and "tcr2" have to have a low by correctly programming key "U"). value with a very frequent intervention of the control outputs.

In this case use of solid state relays (SSR) to drive the actuators is recommended.

The Double Action PID control algorithm needs the programming of the following parameters:

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1.rEG

"tcr 2" - Cycle time of the output 2.rEG

"rS" - Manual Reset (if "Int =0 only)

"dEr" - Derivative Time

"FuOC" - Fuzzy Overshoot Control

"Prat" - Power Ratio or relation between power of the element controlled by output 2.rEG and power of the element controlled by

If par. "Prat" = 0, the output 2.rEG is disabled and the control behaves exactly as a single action PID controller, through output

4.7 - AUTOTUNING AND SELFTUNING FUNCTIONS

All the parameters referring to the AUTO-TUNING SELF-TUNING functions are contained in the group "1rEG".

The AUTO-TUNING and SELF-TUNING functions permit the

parameters by means of a FAST type tuning cycle and, at the end of this operation, the parameters are stored into the instrument's memory and remain constant during control.

The SELF-TUNING function (rule based "TUNE-IN") instead allows control monitoring and the continuous calculation of the parameters during control.

Both functions automatically calculate the following parameters :

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1rEG

"Int" - Integral Time

"dEr" - Derivative Time

and, for the Double Action PID control, also:

"tcr 2" - Cycle time of the output 2rEG

"Prat" - Power Ratio P 2.rEG/ P 1.rEG

To activate the AUTO-TUNING function proceed as follows:

- 1) Program and activate the desired Set Point.
- 2) Program par. "Cont" =Pid.
- 3) Program par. "Func" according to the process to be controlled through output 1rEG.
- 4) Program an output as 2.rEG if the instrument controls a plant with double action
- 5) Program par. "Auto" as:
- "1" if auto-tuning is desired automatically, each time the instrument is switched on, on the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" =CooL) than [SP+ |SP/2|].
- "2" if auto-tuning is desired automatically, the next time the instrument is switched on, on the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" =CooL) than [SP+ |SP/2|], and once the tuning is finished, the par. "Auto" is automatically swapped to the OFF state
- "3" if manual auto-tuning is desired, by selecting par. "tunE" in the main menu or by correctly programming key "U" as "USrb" = tunE. The Autotuning will start at the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/5|] or higher (with "Func" =CooL) than [SP+ |SP/5|].
- "4" if it's desired to activate the autotuning automatically to every change of Set Point, or at the end of programmed Soft-Start cycle. The Autotuning will start at the condition that the process "Func" =CooL) than [SP+ |SP/5|].
- 6) Exit from the parameter programming.
- 7) Connect the instrument to the controlled plant.
- 8) Activate the Auto-tuning by switch off and turn on the instrument if "Auto"=1 or 2, or by selecting par. "tunE" in the main menu (or

At this point the Auto-tuning function is activated and is indicated by the flashing led AT/ST.

The regulator carries out several operations on the connected plant in order to calculate the most suitable PID parameters.

If, at the Auto-tuning start, the condition for the lower or higher process value is not found the display will show "ErAt" and the instrument will be swapped to normal control conditions according to the previously programmed parameters.

To make the error "ErAt" disappear, press key P.

The Auto-tuning cycle duration has been limited to 12 hours Active Set Point value is changed. maximum.

If Auto-tuning is not completed within 12 hours, the instrument will show "noAt" on the display.

In case of probe error, the instrument automatically stops the cycle

The values calculated by Auto-tuning are automatically stored in the instrument's memory at the end of the correct PID parameters tuning.

Note: The instrument is already programmed in our factory to carry out auto-tuning at every instrument switch on ("Auto" = 1).

To activate the SELF-TUNING function proceed as follows

- 1) Program and activate the desired Set Point.
- 2) Program par. "Cont" =Pid.
- 3) Program par. "Func" according to the process to be controlled through output 1.rEG.
- 4) Program an output as 2.rEG if the instrument controls a dual-action plant
- 5) Program par. "SELF" = yES
- Exit from the parameter programming.
- 7) Connect the instrument to the controlled plant.
- 8) Activate Self-tuning selecting par. "tunE" in the main menu (or by correctly programming key "U").

When the Self-tuning function is active, the led AT/ST is permanently lit up and all the PID parameters ("Pb", "Int", "dEr", etc.) are no longer visualized.

Note: It's always preferable tuning the instrument using the Autotuning and to activate the Selftuning after because the tuning through Selftuning is more slow.

To stop the Auto-tuning cycle or deactivate the Self-tuning function select one of the control types : "rEG", "OPLO" or "OFF" from the All the parameters referring to the Soft -Start functioning are menu "SEL". If the instrument is switched off during Auto-tuning or contained in the group "rEG". with the Self-tuning function activated, these functions will remain activated the next time it is switched on.

4.8 - REACHING OF THE SET POINT AT CONTROLLED SPEED AND AUTOMATIC SWITCHING BETWEEN TWO SET POINTS (RAMPS AND DWELL TIME)

All the parameters referring to the ramps functioning are contained in the group "1rEG".

It is possible to reach the set point in a predetermined time (in any "HSEt" - End Soft Start cycle threshold case longer than the time the plant would naturally need). This could be useful in those processes (heating or chemical treatments, etc.) where the set point has to be reached gradually, in a predetermined time.

Once the instrument has reached the first Set Point (SP1) it is possible to have automatic switching to the second Set Point (SP2) after a set time, thus obtaining a simple automatic process cycle.

These functions are available for all the programmable controls (PID single and double action, ON/OFF and Neutral Zone ON/OFF).

The function is determined by the following parameters:

"SLor" - Gradient of first ramp expressed in unit/minute

"SLoF" - Gradient of second ramp expressed in unit/minute.

"dur.t" - Dwell time of Set Point "SP1" before automatic switching to Set Point "SP2" (expressed in hrs. and min.).

The functions are deactivated when the relative parameters are = InF

Note: In case of PID control, if Auto-tuning is desired whilst the ramp function is active, this will not be carried out until the tuning cycle has been completed. It is therefore recommended that Auto-tuning be started avoiding activating the ramp function and, once the tuning is finished, deactivate Auto-tuning ("Auto" = OFF), program the desired ramp and, if it automatic tuning is desired, enable the Self-tuning function.

If is desired only one ramp (ex. to reach "SP1") it is enough to program on the par. "SLor" the desired value.

The ramp "SLor" it will always active at power on and when the

If it is desired an automatic cycle from the power on instead it is necessary to program the par. "nSP" = 2, to program the two Set Point values "SP1" and "SP2" and naturally to program the par. "SLor", "dur.t" and "SLoF" with the desired values.

In this case at the end of the cycle all the ramps won't be more active

Examples with starts from values lower than SP and with decreasing of SP.

4.9 - SOFT-START FUNCTION

The Soft-Start function only works through PID control and allows the limitation of control power when the instrument is switched on, for a programmable period of time.

This is useful when the actuator, driven by the instrument, may be damaged excess power supplied when the application is not yet in the normal rating. (ex. for certain heating elements).

The function depends on the following parameters:

"St.P" - Soft-Start power

"SSt" - Soft-Start time (expressed in hh.mm)

If both parameters are programmed with values other than OFF, when switched on the instrument gives an output power as programmed on par. "St.P" for the time programmed on par. "SSt" or when is reached the absolute value programmed at par. "HSEt". Practically, the instrument works in manual condition and switches

to automatic control at the elapsing of time "SSt" or when is reached the absolute value programmed at par. "HSEt".

To disable the Soft-Start function simply program par. "SSt" = OFF. Whenever, a measurement errors occurs during the Soft-Start execution, the function is interrupted and the instrument gives an output power as programmed on par. "OPE".

If the measurement is restored, the Soft-Start is still deactivated.

If it's desired to activate the Autotuning with Soft-Start set par. "Auto"=4.

The Autotuning will start automatically at the end of programmed Soft-Start cycle at the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/5|] or higher (with "Func" =CooL) than [SP+ |SP/5|].

4.10 - ALARMS OUTPUTS FUNCTIONS (AL1, AL2, AL3)

The alarms (AL1, AL2, AL3) are depending on the process value and before to set his functioning it's necessary to establish to which output the alarm has to correspond to.

First of all it's necessary to configure, in the parameters group "Out", the parameters relative to the outputs required as alarm ("O1F", "O2F", "O3F") programming the parameter relative to the desired output as follows:

= ALno if the alarm output has to be ON when the alarm is active, while it's OFF when the alarm is not active

- active, while it's OFF when the alarm is active
- active, while it is OFF when the alarm is active but with reverse led "AL1H" and will be deactivated when it goes below the value [AL1H indication (led ON= alarm OFF).

Note: In all the examples that follow is made reference to the alarm AL1. Naturally the operation of the other alarms results analogous.

Have now access at the group "IAL1", and program on par. "OAL1", to which output the alarm signal has to be sent.

The alarm functioning is instead defined by parameters:

- "AL1t" ALARM TYPE
- "Ab1" ALARM CONFIGURATION
- "AL1" ALARM THRESHOLD
- "AL1L" LOW ALARM THRESHOLD (for band alarm) OR MINIMUM SET OF AL1 ALARM THRESHOLD (for low or high alarm)
- "AL1H" HIGH ALARM THRESHOLD (for band alarm) OR MAXIMUM SET OF AL1 ALARM THRESHOLD (for low or high
- "HAL1" ALARM HYSTERESIS
- "AL1d" ALARM ACTIVATION DELAY (in sec.)
- "AL1i" ALARM BEHAVIOUR IN THE **EVENT** MEASUREMENT ERROR

"AL1t" - ALARM TYPE: the alarm output can behave in six different ways.

LoAb = ABSOLUTE LOW ALARM: The alarm is activated when the process value goes below the alarm threshold set on parameter "AL1" and will be deactivated when it goes above the value [AL1+HAL1].

With this mode is possible to program the minimum and the maximum set of "AL1" by "AL1L" and "AL1H" parameters.

HIAb = ABSOLUTE HIGH ALARM: The alarm is activated when the process value goes higher than the alarm threshold set on parameter "AL1" and will be deactivated when it goes below the value [AL1 - HAL1].

With this mode is possible to program the minimum and the maximum set of "AL1" by "AL1L" and "AL1H" parameters

LodE = DEVIATION LOW ALARM: The alarm is activated when the process value goes below the value [SP1 + AL1] and will be With this mode is possible to program the minimum and the ALARM LATCH: the alarm output may behave in two different deactivated when it goes above the value [SP1 + AL1 + HAL1]. maximum set of "AL1" by "AL1L" and "AL1H" parameters.

HidE = DEVIATION HIGH ALARM: The alarm is activated when the process value goes above the value [SP1 + AL1] and will be

maximum set of "AL1" by "AL1L" and "AL1H" parameters

= ALnc if the alarm output has to be ON when the alarm is not LHAb = ABSOLUTE BAND ALARM: The alarm is activated when the process value goes under the alarm threshold set on parameter = ALni if the alarm output has to be ON when the alarm is not "AL1L" or goes higher than the alarm threshold set on parameter HAL1] or when it goes above the value [AL1L + HAL1].

LHdE = DEVIATION BAND ALARM: The alarm is activated when the process value goes below the value [SP1 + AL1L] or goes above than the value [SP1 + AL1H] and will be deactivated when it goes below the value [SP1 + AL1H - HAL1] or when it goes above the value [SP1 + AL1L + HAL1].

"Ab1" - ALARM CONFIGURATION: This parameter can assume a value between 0 and 15

The number to be set, which will correspond to the function desired, is obtained by adding the values reported in the following descriptions

ALARM BEHAVIOUR AT SWITCH ON: the alarm output may behave in two different ways, depending on the value added to par. "Ab1".

+0 = NORMAL BEHAVIOUR: The alarm is always activated when there are alarm conditions.

+1 = ALARM NOT ACTIVATED AT SWITCH ON: If, when switched on, the instrument is in alarm condition, the alarm is not activated. It will be activated only when the process value is in non-alarm conditions and then back in alarm conditions.

exemple with absolute low alarm

ALARM DELAY: the alarm output may behave in two different ways depending on the value added to par. "Ab1".

+0 = ALARM NOT DELAYED: The alarm is immediately activated when the alarm condition occurs.

+2 = ALARM DELAYED: When the alarm condition occurs, delay counting begins, as programmed on par. "AL1d" (expressed in sec.) and the alarm will be activated only after the elapsing of that

ways depending on the value added to par. "Ab1".

+ 0 = ALARM NOT LATCHED: The alarm remains active in alarm conditions only.

+ 4 = ALARM LATCHED: The alarm is active in alarm conditions With this mode is possible to program the minimum and the and remains active even when these conditions no longer exist, until the correctly programmed key "U", ("USrb"=Aac) has been pushed.

exemple with absolute high alarm

ALARM AKNOWLEDGEMENT: the alarm output may behave in = noF : no function two different ways depending on the value added to par. "Ab1".

- + 0 = ALARM NOT AKNOWLEDGED: The alarm always remains possible to acknowledge the alarm. (see par. 4.10) active in alarm conditions.
- + 8 = ALARM AKNOWLEDGED: The alarm is active in alarm possible to acknowledge an active alarm (see par. 4.10) conditions and can be deactivated by key "U" if properly = HoLd :Closing the contact connected to the digital input 1 there is programmed ("USrb"=ASi), and also if alarm conditions still exist.

ERROR: This allows one to establish how the alarm have behave operate the control in base to the memorized measure. in the event of a measurement error (yES=alarm active; no=alarm Reopening the contact the instrument come back to the normal deactivated).

4.11 - LOOP BREAK ALARM FUNCTION

All the parameters referring to the Loop Break alarm function are = CHSP : Closing and opening the contact connected to the digital contained in the group "LbA".

The Loop Break alarm is available on all the instruments, which Points on rotation. intervenes when, for any reason (short-circuit of a thermocouple, = SP1.2 : Closing the contact connected to the digital input 1 it is thermocouple inversion, load interruption), the loop control is possible to select as active the set point SP2. Reopening the interrupted.

to correspond.

To do this it is necessary to set the parameter relative to the output through the key U. to be used ("O1F", "O2F", "O3F") in the group "Out", = SP1.4: The following combination of the connected contacts to programming the parameter as:

- **= ALno** if the alarm output has to be ON when the alarm is active memorized set points. while it is OFF when the alarm is not active.
- = ALnc if the alarm output has to be ON when the alarm is not active while it is OFF when the alarm is active.
- **= ALni** if the alarm output has to be ON when the alarm is not active, while it is OFF when the alarm is active but with reverse led indication (led ON= alarm OFF).

Enter group "JLbA" and program which output the alarm signal has to be addressed to on par. "OLbA",.

the 100% of the value for the time programmed on par. "LbAt" (expressed in sec.).

To avoid false alarms, the value of this parameter has to be set considering the time the plant takes to reach the Set point when the 4.14 - RS 485 SERIAL INTERFACE measured value is a long distance from it (for example at the plant The instrument can be equipped with a RS 485 serial start-up).

group "InP").

mode "OFF" and then re-program the automatic control ("rEG") software protocol adopted for TLK35 is a MODBUS RTU type, after checking the correct functioning of probe and actuator.

To exclude the Loop Break alarm, set "OLbA" = OFF.

4.12 - FUNCTIONING OF KEY "U"

The function of key "U" can be set through par. "USrb" contained To maintain the line in rest conditions a 120 Ohm resistance (Rt) in the group ""PAn".

The parameter can be programmed as :

- = noF: no function
- = tunE : Pushing the key for 1 sec. at least, it is possible to activate/deactivate Auto-tuning or Self-tuning
- from automatic control (rEG) to manual one (OPLO) and vice versa. and being present potential differences between the GND
- acknowledge the alarm. (see par. 4.10)
- = ASi : Pushing the key for 1 sec. at least, it is possible to acknowledge an active alarm (see par. 4.10)
- **= CHSP**: Pushing the key for 1 sec. at least, it is possible to select one of the 4 pre-programmed Set Points on rotation.
- = OFF: Pushing the key for 1 sec. at least, it is possible to swap from automatic control (rEG) to OFF control (OFF) and vice versa.

4.13 - DIGITAL INPUTS

The instrument can be equipped with 2 digital inputs.

The function of the digital inputs can be set through par. "diF" contained in the group ""InP".

The parameter can be programmed as:

- = Aac : Closing the contact connected to the digital input 1 it is
- = ASi :Closing the contact connected to the digital input 1 it is
- the hold of the measure in that instant (P.A.: not the reading on the display, therefore the indication could settle with a proportional "AL1i" - ALARM ACTIVATION IN CASE OF MEASUREMENT delay to the filter of measure). With the function hold the instrument

acquisition of the measure.

- = OFF : Closing the contact connected to the digital input 1 it is possible to select the OFF control (OFF).
- input 1 it is possible to select one of the 4 pre-programmed Set
- contact is select as active the set point SP1. This function is First of all, it is necessary to establish to which output the alarm has possible only when "nSP" = 2, and when is selected it disables the selection of the active set through the parameter "SPAt" and

the two digital entries allows the activation of one of the 4

DIG IN1	DIG IN2	SET POINT
off	off	SP1
on	off	SP2
off	on	SP3
on	on	SP4

when this function is selected it disables the selection of the active set through the parameter "SPAt" and through the key U.

= HE.Co : Closing the contact connected to the digital input 1 it is The Loop Break alarm is activated if the output power remains at possible to select as active the set point SP2 in "CooL" mode. Reopening the contact is select as active the set point SP1 in "HEAt" mode. This function is possible only when "nSP" = 2.

communication interface, by means of which it is possible to On alarm intervention, the instrument visualizes the message connect the regulator with a net to which other instruments "LbA" and behaves as in the case of a measurement error giving a (regulators of PLC) are connected, all depending typically on a power output as programmed on par. "OPE" (programmable in the personal computer used as plant supervisor. Using a personal computer it is possible to acquire all the function information and to To restore normal functioning after the alarm, select the control program all the instrument's configuration parameters. The widely used in several PLC and supervision programs available on the market (TLK series protocol manual is available on request).

The interface circuit allows the connection of up to 32 instruments on the same line.

must be connected to the end of the line.

The instrument is equipped with two terminals called A and B which have to be connected with all the namesake terminals of the net. For the wiring operation they must be interlaced with a double cable (telephonic type).

= OPLO : Pushing the key for 1 sec. at least, it is possible to swap Nevertheless, particularly when the net results very long or noised = Aac : Pushing the key for 1 sec. at least, it is possible to terminals, it is advisable to adopt a screened cable wired as in the drawing.

If the instrument is equipped with a serial interface, the parameters 3) verify that the instrument or the device are supplied to be programmed are the following, all present in the parameters 4) observe the indication led on the device KEY 01: it has to result group "SEr":

station, from 1 to 255.

"baud": Transmission speed (baud-rate), programmable from 5) if the les results green, press the button placed on the device. 1200 to 38400 baud. All the stations have to have the same 6) observe the indication led : after having pressed the button, the transmission speed.

"PACS": Programming access. If programmed as "LoCL" this becomes green. means that the instrument is only programmable from the 7) now it is possible to disconnect the device. keyboard, if programmed as "LorE" it is programmable both from the keyboards and serial line.

If an attempt is made to enter the programming from the keyboard manual. whilst a communication through the serial port is in progress the instrument will visualise "buSy" to indicate the busy state.

4.15 - PARAMETERS CONFIGURATION BY "KEY01"

fer from and toward the instrument of the functioning parameters automatically disabled as unnecessary through the device TECNOLOGIC KEY01 with 5 poles connector.

This device it's mainly useable for the serial programming of the **Group "1 SP"** (parameters relative to the Set Point) instruments which need to have the same parameters configuration or to keep a copy of the programming of an instrument and allow its rapid retransmission.

To use the device KEY01 it's necessary that the device or instrument are being supplied.

Instrument supplied and device not supplied

Instrument supplied from the device

P.A.: For the instruments equipped with RS485 communication, it's indispensable that the parameter "PACS" is programmed = LorE.

To transfer the configuration of an instrument into the device (UPLOAD) it is necessary to proceed in the following way:

- 1) position both dip switch of KEY 01 in the **OFF** mode.
- 2) connect the device to the instrument TLK plugging the special connector
- 3) verify that the instrument or the device are supplied
- 4) observe the indication led on the device KEY 01: if it results green this means that a configuration is already loaded on the device while if it results green blinking or red blinking this means that it has not been loaded any valid configuration on the device.
- 5) press the button placed on the device.
- 6) observe the indication led: after having pressed the button, the led becomes red and therefore, at the end of the data transfer, it becomes green.
- 7) now it is possible to disconnect the device.
- To transfer the configuration loaded on the device onto an instrument of the same family (DOWNLOAD), it is necessary to proceed in the following way:
- 1) position both dip switch of KEY 01 in the **ON** mode.
- 2) connect the device to an instrument TLK having the same features of the one from which has been downloaded the desired configuration, plugging the special connector.

- green, because if the led results green blinking or red blinking, this "Add": Address of the station. Set a different number for each means that on the device it has not been downloaded any valid configuration and therefore it's useless to continue.

 - led becomes red and therefore, at the end of the data transfer, it

For additional info, please have a look at the KEY01 instruction

6 - PROBLEMS, MAINTENANCE AND GUARANTEE

6.1 - ERROR SIGNALLING

Error	Reason	Action
	Probe interrupted	Verify the correct
uuuu	The measured variable is under the probe's limits (under-range)	connection between probe and instrument and then verify the correct functioning of the probe
0000	The measured variable is over the probe's limits (over-range)	
ErAt	Auto-tuning not possible because the process value is too higher or too lower	Push key "P" in order to make the error message disappear. Once the error has been found, try to repeat the auto-tuning.
noAt	Auto-tuning not finished within 12 hours	Check the functioning of probe and actuator and try to repeat the auto-tuning.
LbA	Loop control interrupted (Loop break alarm)	Check the working of probe and actuator and swap the instrument to (rEG) control
ErEP	Possible anomaly of the EEPROM memory	Push key "P"

In error conditions, the instrument provides an output power as programmed on par. "OPE" and activates the desired alarms, if the relative parameters "ALni" have been programmed = yES.

6.2 - CLEANING

We recommend cleaning of the instrument with a slightly wet cloth using water and not abrasive cleaners or solvents which may damage the instrument.

6.3 - GUARANTEE AND REPAIRS

The instrument is under warranty against manufacturing flaws or faulty material, that are found within 12 months from delivery date. The guarantee is limited to repairs or to the replacement of the instrument. The eventual opening of the housing, the violation of the instrument or the improper use and installation of the product will bring about the immediate withdrawal of the warranty's effects. In the event of a faulty instrument, either within the period of warranty, or further to its expiry, please contact our sales department to obtain authorisation for sending the instrument to our company. The faulty product must be shipped to TECNOLOGIC with a detailed description of the faults found, without any fees or charge for Tecnologic, except in the event of alternative agreements.

7 - TECHNICAL DATA

7.1 - ELECTRICAL DATA

Power supply: 24 VAC/VDC, 100... 240 VAC +/- 10%

Frequency AC: 50/60 Hz

Power consumption: 5 VA approx.

<u>Input/s:</u> 1 input for temperature probes: tc J,K,S ; infrared sensors TECNOLOGIC IRS J e K; RTD Pt 100 IEC; PTC KTY 81-121 (990 Ω @ 25 °C); NTC 103AT-2 (10K Ω @ 25 °C) or mV signals 0...50 mV, 0...60 mV, 12 ...60 mV or normalized signals 0/4...20 mA, 0..1 V, 0/1...5 V , 0/2...10 V. 2 digital inputs for free voltage contacts.

Normalized signals input impedance: 0/4..20 mA: 51 Ω ; mV and

Output/s: Up to 3 outputs. Relay OUT1 and 2 SPDT (8 A-AC1, 3 A-AC3 / 250 VAC),OUT3 SPST-NO (5 A-AC1, 2 A-AC3 / 250 VAC) ; or in tension to drive SSR (8mA/ 8VDC).

Auxiliary supply output: 10 VDC / 20 mA Max.

Electrical life for relay outputs: 100000 operat.

Installation category: II Measurement category: I

Protection class against electric shock: Class II for Front panel Insulation: Reinforced insulation between the low voltage section (supply and relay outputs) and the front panel; Reinforced insulation between the low voltage section (supply and relay outputs) and the extra low voltage section (inputs, SSR outputs); No insulation between input and SSR outputs; 50 V insulation between RS485 and extra low voltage section.

7.2 - MECHANICAL DATA

Housing: Self-extinguishing plastic, UL 94 V0

Dimensions: 4 DIN modules ,70 x 84 mm, depth 60 mm

Weight: 180 g approx.

Mounting: Enclosure on DIN OMEGA rail Connections: 2,5 mm² screw terminals block

Pollution situation: 2

Operating temperature: 0 ... 50 °C

Operating humidity: 30 ... 95 RH% without condensation

Storage temperature: -10 ... +60 °C

7.3 - MECHANICAL DIMENSIONS [mm]

7.4 - FUNCTIONAL FEATURES

Control: ON/OFF, ON/OFF Neutral Zone, PID single Action, PID double action.

Measurement range: according to the used probe (see range table) Display resolution: according to the probe used 1/0,1/0,01/0,001

Overall accuracy: +/- 0,5 % fs (tc S: +/- 1 % fs)

Sampling rate: 130 ms.

Serial Interface: RS485 insulated

Communication protocol: MODBUS RTU (JBUS) Baud rate: Programmable from 1200 ... 38400 baud

Display: 4 Digit Red h 12 mm

Compliance: ECC directive EMC 2004/108/CE (EN 61326). ECC S = RS 485 Serial interface

directive LV 2006/95/CE (EN 61010-1)

7.6 - INSTRUMENT ORDERING CODE

TLK35 a b c d e f g hh i

a: POWER SUPPLY

L = 24 VAC/VDC

H = 100... 240 VAC

b: INPUT

C = thermocouples (J, K, S, I.R), mV, thermoresistances (Pt100)

E = thermocouples (J, K, S, I.R.), mV, thermistors (PTC, NTC)

I = normalized signals 0/4..20 mA

V = normalized signals 0..1 V, 0/1..5 V, 0/2..10 V.

c: OUTPUT OUT1

R = Relay

O = VDC for SSR

d: OUTPUT OUT2

R = Relay

O = VDC for SSR

- = None

e: OUTPUT OUT3

R = Relay

O = VDC for SSR

- = None

f: COMMUNICATION INTERFACE

- = No interface

g: DIGITAL INPUTS

I = 2 digital inputs

- = None

hh: SPECIAL CODES

i: SPECIAL VERSIONS

TLK 35 PASSWORD = 381
