1 - INSTRUMENT DESCRIPTION

1.1 - GENERAL DESCRIPTION

TLK 38 is a "single loop" digital microprocessor-based controller, with ON/OFF, Neutral Zone ON/OFF, PID single action, PID dual action (direct and reverse) control and with AUTO-TUNING FAST function, SELF-TUNING function and automatic calculation of the FUZZY OVERSHOOT CONTROL parameter for PID control. The PID control has a particular algorithm with TWO DEGREES OF **FREEDOM** that optimises the instrument's features independently in the event of process disturbance and Set Point variations. The process value is visualized on 4 red displays, while the output with a 3 LED programmable shift indexes. The instrument provides for the storage of 4 Set Points and can have up to 2 outputs: relay

C: Thermocouples temperature probes (J,K,S and TECNOLOGIC The same applies to each person or Company involved in the IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), Thermoresistances PT100.

I: normalized analogue signals 0/4..20 mA

V: normalized analogue signals 0..1 V, 0/1..5 V, 0/2..10 V

Other important available functions are: Loop-Break Alarm function, reaching of the Set Point at controlled speed, ramp and dwell

function, Soft-Start function, protection compressor function for neutral zone control, parameters protection on different levels.

1.2 - FRONT PANEL DESCRIPTION

- 1 Key P: This is used to access the programming parameters and to confirm selection.
- 2 Key DOWN: This is used to decrease the values to be set and to select the parameters. If the key is held down, the user returns to the previous programming level until he exits the programming mode.
- 3 Key UP: This is used to increase the values to be set and to select the parameters. If the key is held down, the user returns to the previous programming level until he exits the programming mode. Outside the programming mode it permits visualisation of the output control power.
- 4 Key U: This is a key with a function programmable by par. "USrb". It can be set to: Activate Auto-tuning and Self-tuning functions, swap the instrument to manual control, silence the alarm, change the active Set Point, deactivate control (see par. 4.12) and modify the visibility of the parameters in "ConF" menu (see par. 2.3).
- 5 Led OUT1: indicates the state of output OUT1
- 6 Led OUT2 : indicates the state of output OUT2
- 7 Led SET : It indicates access to the programming mode and parameter programming level.
- 8 Led AT/ST: indicates that the Self-tuning function is activated (light on) or that Auto-tuning (flashing) is in progress.
- 9 Led Shift index: indicates that the process value is lower than the one programmed on par. "AdE".
- 10 Led = Shift index: indicates that the process value is within the range [SP+AdE ... SP-AdE]
- 11 Led + Shift index: indicates that the process value is higher than the one set on par. "AdE".

2 - PROGRAMMING

2.1 - FAST PROGRAMMING OF THE SET POINT

and possibly the alarm thresholds (see par 2.3)

Push key "P", then release it and the display will visualise "SP n" (where n is the number of the Set Point active at that moment) programming mode.

If the password is correct, the display will visualise the code alternatively to the programmed value.

key to decrease it.

These keys change the value one digit at a time but if they are pressed for more than one second, the value increases or decreases rapidly and, after two seconds in the same condition, the identifying the first parameter of the selected group will be changing speed increases in order to allow the desired value to be reached rapidly.

Once the desired value has been reached, by pushing key P it is visualise the alarm thresholds (see par. 2.3).

To exit the fast Set programming it is necessary to push key P, is pressed for approx. 15 seconds, the display will return to normal only the code of the selected parameter. functioning automatically.

2.2 - SELECTION OF THE CONTROL STATE AND PARAMETER **PROGRAMMING**

By pushing key "P" and holding it down for approx. 2 sec. it is possible to enter into the main selection menu.

Using the "UP" or DOWN" keys, it is then possible to roll over the selections:

Output

Down to enter into the main selection menu.

Down to enter into the main selection menu.

Possible to select a new group.

To exit the programming mode, no key should be pressed for selections:

"OPEr"	to enter into the operating parameters menu

"ConF"	to enter into the configuration parameters menu		
"OFF"	to swap the regulator into the OFF state		
"rEG"	to swap the regulator into the automatic control state		
"tunE"	to activate the Auto-tuning or Self-tuning function		
"OPLO"			
	therefore to program the % control value using the		
	"UP" and "DOWN" keys		

Once the desired item has been selected, push key "P" to confirm. Selecting "OPEr" and "ConF" gives the possibility of accessing other menus containing additional parameters and more precisely: "OPEr" - Operating parameters Menu: this normally contains the

Set Point parameters but it can contain all the desired parameters (see par. 2.3).

"ConF" - Configuration parameters Menu: this contains all the operating parameters and the functioning configuration parameters

To enter the menu "ConF" select the option "ConF", press the key "P" and the display will show "0".

This procedure permits rapid programming of the active Set Point At this request, enter, using keys "UP" and "DOWN", the number reported on the last page of this manual and push key "P".

If an incorrect password is entered, the instrument exit from

To modify the value, press "UP" key to increase it or the "DOWN" identifying the first group of parameters (" "SP") and with keys "UP" and "DOWN" it will be possible to select the desired group of

> Once the desired group of parameters has been selected, the code visualised by pushing the "P" key.

Again using the "UP" and "DOWN" keys, it is possible to select the desired parameter and, if the key "P" is pressed, the display will possible to exit by the fast programming mode or it is possible to alternatively show the parameter's code and its programming value, which can be modified by using the "UP" or "DOWN" keys.

Once the desired value has been programmed, push key "P" once after the visualisation of the last Set Point, or alternatively, if no key more: the new value will be memorised and the display will show

By using the "UP" or "DOWN" keys, it is then possible to select a new parameter (if present) and modify it as described above.

To select another group of parameters, keep the "UP" or "DOWN" key pressed for approx. 2 sec., afterwards the display will return to visualise the code of the group of parameters.

Release the key and by using the "UP" and "DOWN" keys, it will be

approx. 20 seconds, or keep the "UP" or "DOWN" pressed until exit from the programming mode is obtained.

The programming and exit modes for the "OPEr" menu are the CONTROL OFF (OFF) - The instrument can be swapped into the same as those described for menu "ConF" with the difference that "OFF" state, i.e. the control and the relative outputs are to access the menù "OPEr" the Password is not required.

ATTENTION: The instrument is programmed in factory with all the parameters, to exception of the Set Point "SP1" (and 2,3,4), programmable in the menù "ConF" to the purpose to prevent wrong accidental programming from non experienced consumers.

2.3 - PARAMETERS PROGRAMMING LEVELS

The menu "OPEr" normally contains the parameters used to program the Set Point; however it is possible to make all desired parameters appear or disappear on this level, by following this procedure:

Enter the menu "ConF" and select the parameter to be made programmable or not programmable in the menu "OPEr".

Once the parameter has been selected, if the LED SET is switched menu "ConF", if instead the LED is on, this means that the programmed on par. "SPLL" and the one programmed on par. parameter is also programmable in the menu "OPEr".

SET will change its state indicating the parameter accessibility level (on = menu "OPEr" and "ConF"; off = menu "ConF" only).

The active Set Point and the alarm thresholds will only be visible on the Set Point fast programming level (described in par. 2.1) if the 3 - INFORMATION ON INSTALLATION AND USE relative parameters are programmed to be visible (i.e. if they are present in the menu "OPEr").

The possible modification of these Sets, with the procedure described in par. 2.1, is instead subordinate to what is programmed in par. "Edit" (contained in the group " PAn ").

This parameter can be programmed as:

=SE: The active Set Point can be modified while the alarm thresholds cannot be modified.

thresholds can be modified

modified

be modified

2.4 - CONTROL STATES

The controller can act in 3 different ways: automatic control (rEG), control off (OFF) and manual control (OPLO).

The instrument is able to pass from one state to the other:

- by selecting the desired state from the main selection menu suing the keyboard.
- and vice versa.
- Automatically (the instrument swaps into "rEG" state at the and of adequate ventilation to the instrument and avoid installation in the auto-tuning execution)

state it was in when it was last switched off.

functioning state of the controller.

During automatic control it is possible to visualize the control power on the display by pushing key "UP".

direct action).

deactivated.

The alarm outputs are instead working normally.

BUMPLESS MANUAL CONTROL (OPLO) - By means of this option it is possible to manually program the power percentage given as output by the controller by deactivating automatic control. When the instrument is swapped to manual control, the power percentage is the same as the last one supplied and can be modified using the "UP" and "DOWN" keys.

As in the case of automatic control, the programmable values range from H100 (+100%) to C100 (-100%).

To return to automatic control, select "rEG" in the selection menu.

2.5 - ACTIVE SET POINT SELECTION

This instrument permits pre-programming of up to 4 different Set points ("SP1", "SP2", "SP3", "SP4") and then selection of which one must be active. The maximum number of Set points is determined by the par. "nSP" located in the group of parameters " ISP ".

The active Set point can be selected:

- by parameter "SPAt" in the group of parameters " 1SP ".
- by key "U" if par. "USrb" = CHSP

- Automatically between SP1 and SP2 if a time "dur.t" (see par. 4.8) has been programmed.

Set Points "SP1", "SP2", "SP3", "SP4" will be visible depending on the maximum number of Set Points selected on par. "nSP" and they off, this means that the parameter is programmable only in the can be programmed with a value that is between the value "SPHL".

To modify the visibility of the parameter, push key "U": the LED Note: in all the following examples the Set point is indicated as "SP", however the instrument will act according to the Set point selected as active.

3.1 - PERMITTED USE

The instrument has been projected manufactured as a measuring and control device to be used according to EN61010-1 for the altitudes operation until 2000 ms. The use of the instrument for applications not expressly permitted by the

above mentioned rule must adopt all the necessary protective =AE: The active Set Point cannot be modified while the alarm measures. The instrument CANNOT be used in dangerous environments (flammable or explosive) without adequate =SAE : Both the active Set Point and the alarm thresholds can be protection. The installer must ensure that EMC rules are respected, also after the instrument installation, if necessary using proper =SAnE: Both the active Set Point and the alarm thresholds cannot filters. Whenever a failure or a malfunction of the device may cause dangerous situations for persons, thing or animals, please remember that the plant has to be equipped with additional devices which will guarantee safety.

3.2 - MECHANICAL MOUNTING

The instrument, in case 33 x 75 mm, is designed for flush-in panel mounting. Make a hole 29 x 71 mm and insert the instrument, fixing it with the provided special bracket. We recommend that the gasket - By using the key "U" on the keyboard; suitably programming par. is mounted in order to obtain the front protection degree as "USrb" ("USrb" = tunE; "USrb" = OPLO; "USrb" = OFF) it is possible declared. Avoid placing the instrument in environments with very to pass from "rEG" state to the state programmed on the parameter high humidity levels or dirt that may create condensation or introduction of conductive substances into the instrument. Ensure containers that house devices which may overheat or which may When switched on, the instrument automatically reassumes the cause the instrument to function at a higher temperature than the one permitted and declared. Connect the instrument as far away as AUTOMATIC CONTROL (rEG) - Automatic control is the normal possible from sources of electromagnetic disturbances such as motors, power relays, relays, solenoid valves, etc.

3.3 - ELECTRICAL CONNECTION

The range of the power values goes from H100 (100% of the output Carry out the electrical wiring by connecting only one wire to each power with reverse action) to C100 (100% of the output power with terminal, according to the following diagram, checking that the power supply is the same as that indicated on the instrument and that the load current absorption is no higher than the maximum electricity current permitted. As the instrument is built-in equipment with permanent connection inside housing, it is not equipped with - for normalised signals in current 0..20 mA (0.20) or 4..20 mA either switches or internal devices to protect against overload of (4.20) current: the installation will include an overload protection and a - for normalised signals in tension 0..1 V (0.1), 0..5 V (0.5), 1..5 V two-phase circuit-breaker, placed as near as possible to the (1.5), 0..10 V (0.10) or 2..10 V (2.10). the user and marked as instrument disconnecting device which 12..60 mV (12.60). interrupts the power supply to the equipment. It is also We recommend to switch on and off the instrument when these recommended that the supply of all the electrical circuits connected parameters are modified, in order to obtain a correct measuring. to the instrument must be protect properly, using devices (ex. For the instruments with input for temperature probes (tc, rtd) it's fuses) proportionate to the circulating currents. It is strongly possible to select, through par. "Unit", the unit of measurement recommended that cables with proper insulation, according to the (°C, °F) and, through par. "dP" (Pt100, PTC and NTC only) the working voltages and temperatures, be used. Furthermore, the desired resolution (0=1°; 1=0,1°). input cable of the probe has to be kept separate from line voltage. Instead, with regards to the instruments with normalised analogue wiring. If the input cable of the probe is screened, it has to be input signals, it is first necessary to program the desired resolution connected to the ground with only one side. Whether the on par. "dP" (0=1; 1=0,1; 2=0,01; 3=0,001) and then, on par. instrument is 12 V version it's recommended to use an external "SSC", the value that the instrument must visualise at the transformer TCTR, or with equivalent features, and to use only one beginning of the scale (0/4 mA, 0/12 mV, 0/1 V o 0/2 V) and, on transformer for each instrument because there is no insulation par. "FSC", the value that the instrument must visualise at the end between supply and input. We recommend that a check should be made that the parameters are those desired and that the The instrument allows for measuring calibration, which may be actuators so as to avoid malfunctioning that may cause by using par. "OFSt" and "rot". irregularities in the plant that could cause damage to people, things Programming par. "rot"=1,000, in par. "OFSt" it is possible to set a or animals.

any responsibility for any damage to people, things or animals measurements. deriving from violation, wrong or improper use or in any case If instead, it is desired that the offset set should not be constant for not in compliance with the instrument's features.

3.4 - ELECTRICAL WIRING DIAGRAM

4 - FUNCTIONS

4.1 - MEASURING AND VISUALIZATION

All the parameters referring measurements are contained in the In case of measurement error, the instrument supplies the power group "InP".

Depending on the model required the input accept:

Thermoresistances PT100.

E: Thermocouples temperature probes (J,K,S and TECNOLOGIC IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), Thermistors PTC and NTC.

I: normalized analogue signals 0/4..20 mA

V: normalized analogue signals 0..1 V, 0/1..5 V, 0/2..10 V

Depending on the model, using par. "SEnS", it's possible to select the type of input probe, which can be:

serie TECNOLOGIC IRTC1 with linearization J (Ir.J) or K (Ir.CA)

- for thermoresistances Pt100 IEC (Pt1) or thermistors PTC breakage KTY81-121 (Ptc) or NTC 103AT-2 (ntc)

instrument, and located in a position that can easily be reached by - for normalised signals in tension 0..50 mV (0.50), 0..60 mV (0.60),

of the scale (20 mA, 50 mV, 60 mV, 5 V or 10 V).

application functions correctly before connecting the outputs to the used to recalibrate the instrument according to application needs,

positive or negative offset that is simply added to the value read by Tecnologic S.p.A. and its legal representatives do not assume the probe before visualisation, which remains constant for all the

> all the measurements, it is possible to operate the calibration on any two points.

> In this case, in order to decide which values to program on par. "OFSt" and "rot", the following formulae must be applied:

"rot" = (D2-D1) / (M2-M1)"OFSt" = D2 - ("rot" x M2) where:

M1 =measured value 1

D1 = visualisation value when the instrument measures M1

M2 =measured value 2

D2 = visualisation value when the instrument measures M2

It then follows that the instrument will visualise:

DV = MV x "rot" + "OFSt"

where: DV = visualised value MV= measured value Example 1: It is desired that the instrument visualises the value effectively measured at 20° but that, at 200°, it visualises a value lower than 10° (190°).

Therefore: M1=20; D1=20; M2=200; D2=190

"rot" = (190 - 20) / (200 - 20) = 0,944"OFSt" = $190 - (0.944 \times 200) = 1.2$

Example 2: It is desired that the instrument visualises 10° whilst the value actually measured is 0°, but, at 500° it visualises a 50° higher value (550°).

Therefore: M1=0; D1=10; M2=500; D2=550

"rot" = (550 - 10) / (500 - 0) = 1,08"OFSt" = $550 - (1.08 \times 500) = 10$

By using par. "FiL" it is possible to program time constant of the software filter for the input value measured, in order to reduce noise sensitivity (increasing the time of reading).

as programmed on par. "OPE".

This power will be calculated according to cycle time programmed C: Thermocouples temperature probes (J,K,S and TECNOLOGIC for the PID controller, while for the ON/OFF controllers the cycle IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), time is automatically considered to be equal to 20 sec. (e.g. In the event of probe error with ON/OFF control and "OPE"=50, the control output will be activated for 10 sec., then it will be deactivated for 10 sec. and so on until the measurement error

> By using par. "InE" it is also possible to decide the conditions of the input error, allowing the instrument to give the power programmed on par. "OPE" as output.

The possibilities of par. "InE" are:

- for thermocouples J (J), K (CrAL), S (S) or for infrared sensors = Ur : the condition occurs in case of under-range or probe = Or : the condition occurs in case of over-range or probe breakage

= OUr: the condition occurs in case of over-range or under-range This type of control can be obtained when 2 outputs are or probe breakage

Using par. "diSP", located in the group "PAn", it is possible to set = nr. normal visualization of the display which can be the process The Neutral Zone control is used to control plants in which there is variable (dEF), the control power (Pou), the active Set Point (SP.F) an element which causes a positive increase (ex. Heater, the Set Point operating when there are active ramps (SP.o) or humidifier, etc.) and an element which causes a negative increase alarm threshold AL1 or AL2 (AL1, AL2).

Again in the group "PAn" the par. "AdE" is present that defines the 3 led shift index functioning.

The lighting up of the green led = indicates that the process value hysteresis "HSEt". is within the range [SP+AdE ... SP-AdE], the lighting up of the led than [SP+AdE].

4.2 - OUTPUTS CONFIGURATION

of parameters "Out, where the relative parameters "O1F" and causing a negative increase has to be connected to the output "O2F" (depending on the number of outputs available on the programmed as 2.rEG. instrument) are located.

The outputs can be set for the following functions:

- Main control output (1.rEG)
- Secondary control output (2.rEG)
- Alarm output normally open (ALno)
- Alarm output normally closed (ALnc)
- Alarm output normally closed with led reverse indication (ALni)
- Output deactivated (OFF)

The coupling outputs number outputs - number alarms can be made in the group referring to the alarm to the alarm ("AL1", "]AL2").

4.3 - ON/OFF CONTROL (1.rEG)

All the parameters referring to the ON/OFF control are contained in the group "1rEG".

This type of control can be obtained by programming par. "Cont" = On.FS or = On.FA and works on the output programmed as 1.rEG, This function allows a control by time on the output 2.rEG depending on the measure, on the active Set Point "SP", on the functioning mode "Func" and on the hysteresis "HSEt".

The instrument carries out an ON/OFF control with symmetric hysteresis if "Cont" = On.FS or with asymmetrical hysteresis if

The control works in the following way: in the case of reverse action, or heating ("FunC"=HEAt), it deactivates the output, when the process value reaches [SP + HSEt] in case of symmetrical hysteresis, or [SP] in case of asymmetrical hysteresis and is then activated again when the process value goes below value [SP -HSEt1.

Vice versa, in case of direct action or cooling ("Func"=CooL), it deactivates the output, when the process value reaches [SP -HSEt] in case of symmetrical hysteresis, or [SP] in case of asymmetrical hysteresis and is activated again when the process value goes above value [SP + HSEt].

4.4 - NEUTRAL ZONE ON/OFF CONTROL (1.rEG - 2.rEG)

contained in the group "1rEG".

programmed respectively as 1.rEG and 2.rEG and the par. "Cont"

(ex. Cooler, de-humidifier, etc).

The control functions works on the programmed outputs depending on the measurement, on the active Set Point "SP" and on the

The control works in the following way: it deactivates the outputs indicates that the process value is lower than [SP-AdE] and the when the process value reaches the Set Point and it activates the lighting up of the led + indicates that the process value is higher output 1.rEG when the process value goes below value [SP -HSEt], or it activates the output 2.rEG when the process value goes above [SP + HSEt].

Consequently, the element causing a positive increase has to be The instrument's outputs can be programmed by entering the group connected to the output programmed as 1.rEG while the element

If 2.rEG output is used to control compressor is possible to use the "Compressor Protection" function that has the meaning to avoid compressor "short cycles".

activation, independently by the temperature control request.

The protection is a "delayed after deactivation" type.

This protection permits to avoid the output activation for a time programmable on par. "CPdt" (expressed in sec.); the output activation will occurs only after the elapsing of time "CPdt".

The time programmed on parameter "CPdt" is counted starting from the last output deactivation.

Obviously, whether during the time delay caused by the compressor protection function, the regulator request should stop, the output activation foreseen after time "CPdt" would be erased.

The function is not active programming "CPdt" =OFF.

The led relative to 2.rEG output blinks during the phases of output activation delay, caused by "Compressor Protection" function.

4.5 - SINGLE ACTION PID CONTROL (1.rEG)

All the parameters referring to PID control are contained in the group "1rEG".

The Single Action PID control can be obtained by programming par."Cont" = Pid and works on the output 1.rEG depending on the active Set Point "SP", on the functioning mode "Func" and on the instrument's PID algorithm with two degree of freedom.

In order to obtain good stability of the process variable, in the event All the parameters referring to Neutral Zone ON/OFF control are of fast processes, the cycle time "tcr1" has to have a low value with a very frequent intervention of the control output.

In this case use of a solid state relay (SSR) is recommended for The SELF-TUNING function (rule based "TUNE-IN") instead allows driving the actuator.

The Single Action PID control algorithm foresees the setting of the during control. following parameters:

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1.rEG

"Int" - Integral Time

"rS" - Manual Reset (if "Int =0 only)

"dEr" - Derivative Time

"FuOC" - Fuzzy Overshoot Control

This last parameter allows the variable overshoots at the start up of "tcr 2" - Cycle time of the output 2rEG the process or at the changing of the Set Point to be avoided.

Please remember that a low value on this parameter reduces the

overshoot while a high value increase it.

- 1: Value "FuOC" OK
- 2: Value "FuOC" too high
- 3: Value "FuOC" too low

4.6 - DOUBLE ACTION PID CONTROL (1.rEG - 2.rEG)

group "1rEG".

The Double Action PID control is used to control plants where there an element which causes a negative increase (ex. Cooling).

programmed respectively as 1.rEG and 2.rEG and the par. "Cont" = Pid.

The element causing a positive increase has to be connected to the output programmed as 1.rEG while the element causing a negative cycle. The Autotuning will start at the condition that the process increase has to be connected to the output programmed as 2.rEG. The Double Action PID control works on the outputs 1.rEG and 2.rEG depending on the active Set Point "SP" and on the instrument's PID algorithm with two degrees of freedom.

value with a very frequent intervention of the control outputs.

recommended.

The Double Action PID control algorithm needs the programming of the following parameters:

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1.rEG

"tcr 2" - Cycle time of the output 2.rEG

"Int" - Integral Time

"rS" - Manual Reset (if "Int =0 only)

"dEr" - Derivative Time

"FuOC" - Fuzzy Overshoot Control

"Prat" - Power Ratio or relation between power of the element controlled by output 2.rEG and power of the element controlled by In case of probe error, the instrument automatically stops the cycle output 1.rEG

If par. "Prat" = 0, the output 2.rEG is disabled and the control behaves exactly as a single action PID controller, through output

4.7 - AUTOTUNING AND SELFTUNING FUNCTIONS

All the parameters referring to the AUTO-TUNING SELF-TUNING functions are contained in the group "IrEG".

The AUTO-TUNING and SELF-TUNING functions permit the 1) Program and activate the desired Set Point. automatic tuning of the PID controller.

The AUTO-TUNING function permits the calculation of the PID 3) Program par. "Func" according to the process to be controlled parameters by means of a FAST type tuning cycle and, at the end through output 1.rEG. of this operation, the parameters are stored into the instrument's 4) Program an output as 2.rEG if the instrument controls a memory and remain constant during control.

control monitoring and the continuous calculation of the parameters

Both functions automatically calculate the following parameters:

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1rEG

"Int" - Integral Time

"dEr" - Derivative Time

"FuOC" - Fuzzy Overshoot Control

and, for the Double Action PID control, also:

"Prat" - Power Ratio P 2.rEG/ P 1.rEG

To activate the AUTO-TUNING function proceed as follows:

- 1) Program and activate the desired Set Point.
- 2) Program par. "Cont" =Pid.
- 3) Program par. "Func" according to the process to be controlled through output 1rEG.
- 4) Program an output as 2.rEG if the instrument controls a plant with double action
- 5) Program par. "Auto" as:
- "1" if auto-tuning is desired automatically, each time the instrument is switched on, on the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" =CooL) than [SP+ |SP/2|].
- "2" if auto-tuning is desired automatically, the next time the instrument is switched on, on the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" All the parameters referring to PID control are contained in the =CooL) than [SP+ |SP/2|], and once the tuning is finished, the par. "Auto" is automatically swapped to the OFF state
- "3" if manual auto-tuning is desired, by selecting par. "tunE" in is an element which causes a positive increase (ex. Heating) and the main menu or by correctly programming key "U" as "USrb" = tunE. The Autotuning will start at the condition that the process This type of control can be obtained when 2 outputs are value is lower (with "Func" =HEAt) than [SP- |SP/5|] or higher (with "Func" =CooL) than [SP+ |SP/5|].
 - "4" if it's desired to activate the autotuning automatically to every change of Set Point, or at the end of programmed Soft-Start value is lower (with "Func" =HEAt) than [SP- |SP/5|] or higher (with "Func" =CooL) than [SP+ |SP/5|].
 - 6) Exit from the parameter programming.
 - 7) Connect the instrument to the controlled plant.
- In order to obtain good stability of the process variable, in case of 8) Activate the Auto-tuning by switch off and turn on the instrument fast processes, the cycle times "tcr1" and "tcr2" have to have a low if "Auto"=1 or 2, or by selecting par. "tunE" in the main menu (or by correctly programming key "U").

In this case use of solid state relays (SSR) to drive the actuators is At this point the Auto-tuning function is activated and is indicated by the flashing led AT/ST.

> The regulator carries out several operations on the connected plant in order to calculate the most suitable PID parameters.

> If, at the Auto-tuning start, the condition for the lower or higher process value is not found the display will show "ErAt" and the instrument will be swapped to normal control conditions according to the previously programmed parameters.

To make the error "ErAt" disappear, press key P.

The Auto-tuning cycle duration has been limited to 12 hours maximum.

If Auto-tuning is not completed within 12 hours, the instrument will show "noAt" on the display.

in progress.

The values calculated by Auto-tuning are automatically stored in the instrument's memory at the end of the correct PID parameters

Note: The instrument is already programmed in our factory to carry out auto-tuning at first instrument switch on ("Auto" = 2).

To activate the SELF-TUNING function proceed as follows

- 2) Program par. "Cont" =Pid.
- dual-action plant

- 5) Program par. "SELF" = yES
- 6) Exit from the parameter programming.
- 7) Connect the instrument to the controlled plant.
- by correctly programming key "U").

When the Self-tuning function is active, the led AT/ST is permanently lit up and all the PID parameters ("Pb", "Int", "dEr", 4.9 - SOFT-START FUNCTION etc.) are no longer visualized.

Note: It's always preferable tuning the instrument using the contained in the group "IrEG". Autotuning and to activate the Selftuning after because the tuning The Soft-Start function only works through PID control and allows through Selftuning is more slow.

menu "SEL". If the instrument is switched off during Auto-tuning or the normal rating. (ex. for certain heating elements). with the Self-tuning function activated, these functions will remain The function depends on the following parameters: activated the next time it is switched on.

4.8 - REACHING OF THE SET POINT AT CONTROLLED SPEED "HSEt" - End Soft Start cycle threshold AND AUTOMATIC SWITCHING BETWEEN TWO SET POINTS If both parameters are programmed with values other than OFF, (RAMPS AND DWELL TIME)

in the group "1rEG".

It is possible to reach the set point in a predetermined time (in any Practically, the instrument works in manual condition and switches could be useful in those processes (heating or chemical reached the absolute value programmed at par. "HSEt" treatments, etc.) where the set point has to be reached gradually, in a predetermined time.

possible to have automatic switching to the second Set Point (SP2) output power as programmed on par. "OPE". after a set time, thus obtaining a simple automatic process cycle.

(PID single and double action, ON/OFF and Neutral Zone "Auto"=4. ON/OFF).

The function is determined by the following parameters:

- "SLor" Gradient of first ramp expressed in unit/minute
- "SLoF" Gradient of second ramp expressed in unit/minute.
- "dur.t" Dwell time of Set Point "SP1" before automatic switching to Set Point "SP2" (expressed in hrs. and min.).

The functions are deactivated when the relative parameters are =

If is desired only one ramp (ex. to reach "SP1") it is enough to program on the par. "SLor" the desired value.

If it is desired an automatic cycle from the power on instead it is necessary to program the par. "nSP" = 2, to program the two Set Point values "SP1" and "SP2" and naturally to program the par. "SLor". "dur.t" and "SLoF" with the desired values.

In this case at the end of the cycle all the ramps won't be more active

Examples with starts from values lower than SP and with decreasing of SP.

Note: In case of PID control, if Auto-tuning is desired whilst the ramp function is active, this will not be carried out until the tuning

cycle has been completed. It is therefore recommended that Auto-tuning be started avoiding activating the ramp function and, once the tuning is finished, deactivate Auto-tuning ("Auto" = OFF), 8) Activate Self-tuning selecting par. "tunE" in the main menu (or program the desired ramp and, if it automatic tuning is desired, enable the Self-tuning function.

All the parameters referring to the Soft -Start functioning are

the limitation of control power when the instrument is switched on, for a programmable period of time.

To stop the Auto-tuning cycle or deactivate the Self-tuning function This is useful when the actuator, driven by the instrument, may be select one of the control types: "rEG", "OPLO" or "OFF" from the damaged excess power supplied when the application is not yet in

"St.P" - Soft-Start power

"SSt" - Soft-Start time (expressed in hh.mm)

when switched on the instrument gives an output power as All the parameters referring to the ramps functioning are contained programmed on par. "St.P" for the time programmed on par. "SSt" or when is reached the absolute value programmed at par. "HSEt".

case longer than the time the plant would naturally need). This to automatic control at the elapsing of time "SSt" or when is

To disable the Soft-Start function simply program par. "SSt" = OFF. Whenever, a measurement errors occurs during the Soft-Start Once the instrument has reached the first Set Point (SP1) it is execution, the function is interrupted and the instrument gives an

If the measurement is restored, the Soft-Start is still deactivated.

These functions are available for all the programmable controls If it's desired to activate the Autotuning with Soft-Start set par.

The Autotuning will start automatically at the end of programmed Soft-Start cycle at the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/5|] or higher (with "Func" =CooL) than [SP+ |SP/5|].

4.10 - ALARMS OUTPUTS FUNCTIONS (AL1, AL2)

The alarms (AL1, AL2) are depending on the process value and before to set his functioning it's necessary to establish to which output the alarm has to correspond to.

First of all it's necessary to configure, in the parameters group The ramp "SLor" it will always active at power on and when the "Out", the parameters relative to the outputs required as alarm Active Set Point value is changed. ("O1F", "O2F") programming the parameter relative to the desired output as follows:

- **= ALno** if the alarm output has to be ON when the alarm is active. while it's OFF when the alarm is not active
- = ALnc if the alarm output has to be ON when the alarm is not active, while it's OFF when the alarm is active
- = ALni if the alarm output has to be ON when the alarm is not active, while it is OFF when the alarm is active but with reverse led indication (led ON= alarm OFF).

Note: In all the examples that follow is made reference to the alarm AL1. Naturally the operation of the other alarms results analogous.

Have now access at the group "AL1", and program on par. "OAL1", to which output the alarm signal has to be sent.

The alarm functioning is instead defined by parameters :

"AL1t" - ALARM TYPE

"Ab1" - ALARM CONFIGURATION

"AL1" - ALARM THRESHOLD

"AL1L" - LOW ALARM THRESHOLD (for band alarm) OR MINIMUM SET OF AL1 ALARM THRESHOLD (for low or high alarm)

"AL1H" - HIGH ALARM THRESHOLD (for band alarm) OR MAXIMUM SET OF AL1 ALARM THRESHOLD (for low or high alarm)

"HAL1" - ALARM HYSTERESIS

"AL1d" - ALARM ACTIVATION DELAY (in sec.)

"AL1i" - ALARM BEHAVIOUR IN THE **EVENT** OF MEASUREMENT ERROR

"AL1t" - ALARM TYPE: the alarm output can behave in six is obtained by adding the values reported in the following different ways.

"AL1" and will be deactivated when it goes above the value [AL1+HAL1].

With this mode is possible to program the minimum and the there are alarm conditions. maximum set of "AL1" by "AL1L" and "AL1H" parameters.

process value goes higher than the alarm threshold parameter "AL1" and will be deactivated when it goes below the value [AL1 - HAL1].

With this mode is possible to program the minimum and the maximum set of "AL1" by "AL1L" and "AL1H" parameters.

LodE = DEVIATION LOW ALARM: The alarm is activated when the process value goes below the value [SP + AL1] and will be deactivated when it goes above the value [SP + AL1 + HAL1]. With this mode is possible to program the minimum and the maximum set of "AL1" by "AL1L" and "AL1H" parameters.

HidE = DEVIATION HIGH ALARM: The alarm is activated when the process value goes above the value [SP + AL1] and will be deactivated when it goes below the value [SP + AL1 - HAL1]. With this mode is possible to program the minimum and the conditions only.

maximum set of "AL1" by "AL1L" and "AL1H" parameters

LHAb = ABSOLUTE BAND ALARM: The alarm is activated when the process value goes under the alarm threshold set on parameter "AL1L" or goes higher than the alarm threshold set on parameter "AL1H" and will be deactivated when it goes below the value [AL1H - HAL1] or when it goes above the value [AL1L + HAL1].

LHdE = DEVIATION BAND ALARM: The alarm is activated when the process value goes below the value [SP + AL1L] or goes above than the value [SP + AL1H] and will be deactivated when it goes below the value [SP + AL1H - HAL1] or when it goes above the value [SP + AL1L + HAL1].

"Ab1" - ALARM CONFIGURATION: This parameter can assume a value between 0 and 31.

The number to be set, which will correspond to the function desired, descriptions:

LoAb = ABSOLUTE LOW ALARM: The alarm is activated when the ALARM BEHAVIOUR AT SWITCH ON: the alarm output may process value goes below the alarm threshold set on parameter behave in two different ways, depending on the value added to par. "Ab1".

- +0 = NORMAL BEHAVIOUR: The alarm is always activated when
- +1 = ALARM NOT ACTIVATED AT SWITCH ON: If, when switched HIAb = ABSOLUTE HIGH ALARM: The alarm is activated when the on, the instrument is in alarm condition, the alarm is not activated. It will be activated only when the process value is in non-alarm conditions and then back in alarm conditions.

exemple with absolute low alarm

ALARM DELAY: the alarm output may behave in two different ways depending on the value added to par. "Ab1".

- +0 = ALARM NOT DELAYED: The alarm is immediately activated when the alarm condition occurs.
- +2 = ALARM DELAYED: When the alarm condition occurs, delay counting begins, as programmed on par. "AL1d" (expressed in sec.) and the alarm will be activated only after the elapsing of that time.

ALARM LATCH: : the alarm output may behave in two different ways depending on the value added to par. "Ab1".

- + 0 = ALARM NOT LATCHED: The alarm remains active in alarm
- + 4 = ALARM LATCHED: The alarm is active in alarm conditions and remains active even when these conditions no longer exist, until the correctly programmed key "U", ("USrb"=Aac) has been pushed

exemple with absolute high alarm

ALARM AKNOWLEDGEMENT: : the alarm output may behave in two different ways depending on the value added to par. "Ab1".

- + 0 = ALARM NOT AKNOWLEDGED: The alarm always remains active in alarm conditions.
- + 8 = ALARM AKNOWLEDGED: The alarm is active in alarm conditions and can be deactivated by key "U" if properly programmed ("USrb"=ASi), and also if alarm conditions still exist. ALARM BEHAVIOUR AT SET POINT CHANGE (DEVIATION ALARMS ONLY): the alarm output may behave in two different ways, depending on the value added to par. "Ab1".
- +0 = NORMAL BEHAVIOUR: The alarm is always activated when there are alarm conditions.
- +16 = ALARM NOT ACTIVATED AT SET POINT CHANGE: If, when Set Point change, the instrument is in alarm condition, the alarm is not activated. It will be activated only when the process value is in non-alarm conditions and then back in alarm conditions.

"AL1i" - ALARM ACTIVATION IN CASE OF MEASUREMENT **ERROR:** This allows one to establish how the alarm have behave in the event of a measurement error (yES=alarm active; no=alarm deactivated).

4.11 - LOOP BREAK ALARM FUNCTION

All the parameters referring to the Loop Break alarm function are that it has not been loaded any valid configuration on the device . contained in the group "LbA".

thermocouple inversion, load interruption), the loop control is becomes green. interrupted.

to correspond.

To do this it is necessary to set the parameter relative to the output proceed in the following way: to be used ("O1F", "O2F") in the group "Dut", programming the 1) position both dip switch of KEY 01 in the ON mode. parameter as:

- while it is OFF when the alarm is not active.
- = ALnc if the alarm output has to be ON when the alarm is not 3) verify that the instrument or the device are supplied active while it is OFF when the alarm is active.
- active, while it is OFF when the alarm is active but with reverse led means that on the device it has not been downloaded any valid indication (led ON= alarm OFF).

Enter group "LbA" and program which output the alarm signal 5) if the les results green, press the button placed on the device. has to be addressed to on par. "OLbA",.

the 100% of the value for the time programmed on par. "LbAt" (expressed in sec.).

To avoid false alarms, the value of this parameter has to be set considering the time the plant takes to reach the Set point when the measured value is a long distance from it (for example at the plant

On alarm intervention, the instrument visualizes the message "LbA" and behaves as in the case of a measurement error giving a power output as programmed on par. "OPE" (programmable in the

To restore normal functioning after the alarm, select the control mode "OFF" and then re-program the automatic control ("rEG") after checking the correct functioning of probe and actuator.

To exclude the Loop Break alarm, set "OLbA" = OFF.

4.12 - FUNCTIONING OF KEY "U"

The function of key "U" can be set through par. "USrb" contained in the group ""PAn".

The parameter can be programmed as:

- = noF: no function
- = tunE : Pushing the key for 1 sec. at least, it is possible to activate/deactivate Auto-tuning or Self-tuning
- **= OPLO**: Pushing the key for 1 sec. at least, it is possible to swap from automatic control (rEG) to manual one (OPLO) and vice versa.
- = Aac : Pushing the key for 1 sec. at least, it is possible to acknowledge the alarm. (see par. 4.10)
- = ASi : Pushing the key for 1 sec. at least, it is possible to manual. acknowledge an active alarm (see par. 4.10)
- **= CHSP**: Pushing the key for 1 sec. at least, it is possible to select one of the 4 pre-programmed Set Points on rotation.
- **= OFF**: Pushing the key for 1 sec. at least, it is possible to swap from automatic control (rEG) to OFF control (OFF) and vice versa.

4.13 - PARAMETERS CONFIGURATION BY "KEY01"

The instrument is equipped with a connector that allows the transfer from and toward the instrument of the functioning parameters through the device **TECNOLOGIC KEY01** with **5 poles** connector. This device it's mainly useable for the serial programming of the instruments which need to have the same parameters configuration or to keep a copy of the programming of an instrument and allow its rapid retransmission.

To use the device KEY01 it's necessary that the device or instrument are being supplied.

To transfer the configuration of an instrument into the device (UPLOAD) it is necessary to proceed in the following way:

- 1) position both dip switch of KEY 01 in the **OFF** mode.
- 2) connect the device to the instrument TLK plugging the special connector.
- 3) verify that the instrument or the device are supplied
- 4) observe the indication led on the device KEY 01: if it results green this means that a configuration is already loaded on the

device while if it results green blinking or red blinking this means

- 5) press the button placed on the device.
- The Loop Break alarm is available on all the instruments, which 6) observe the indication led : after having pressed the button, the intervenes when, for any reason (short-circuit of a thermocouple, led becomes red and therefore, at the end of the data transfer, it
 - 7) now it is possible to disconnect the device.
- First of all, it is necessary to establish to which output the alarm has To transfer the configuration loaded on the device onto an instrument of the same family (DOWNLOAD), it is necessary to
- 2) connect the device to an instrument TLK having the same = ALno if the alarm output has to be ON when the alarm is active features of the one from which has been downloaded the desired configuration, plugging the special connector.
- 4) observe the indication led on the device KEY 01: it has to result = ALni if the alarm output has to be ON when the alarm is not green, because if the led results green blinking or red blinking, this configuration and therefore it's useless to continue.
- 6) observe the indication led: after having pressed the button, the The Loop Break alarm is activated if the output power remains at led becomes red and therefore, at the end of the data transfer, it becomes areen.
 - 7) now it is possible to disconnect the device.

Instrument supplied and device not supplied

Instrument supplied from the device

For additional info, please have a look at the KEY01 instruction

5 - PROGRAMMABLE PARAMETERS

Here following are described all the parameters available on the instrument. Some of them could be not present or because they are depending on the type of instrument or because they are automatically disabled as unnecessary.

Group "1 SP" (parameters relative to the Set Point)

•	Par.		Description	cription Range		Note
	1	nSP	Number of the	1 ÷ 4	1	
3	programmable Set point					
	2	SPAt	Active Set point	1 ÷ nSP	1

6 - PROBLEMS, MAINTENANCE AND GUARANTEE

6.1 - ERROR SIGNALLING

6.1 - ERROR SIGNALLING					
Error	Reason	Action			
	Probe interrupted	Verify the correct			
uuuu	The measured variable	connection between probe			
	is under the probe's	and instrument and then			
	limits (under-range)	verify the correct			
0000	The measured variable	functioning of the probe			
	is over the probe's				
	limits (over-range)				
ErAt	Auto-tuning not	Push key "P" in order to			
	possible because the	make the error message			
	process value is too	disappear. Once the error			
	higher or too lower	has been found, try to			
	3	repeat the auto-tuning.			
noAt	Auto-tuning not	<u> </u>			
	finished within 12				
	hours	to repeat the auto-tuning.			
LbA	Loop control	Check the working of			
	interrupted	probe and actuator and			
	(Loop break alarm)	swap the instrument to			
	(200) 5.00. (4.4.11)	(rEG) control			
ErEP	Possible anomaly of	Push key "P"			
LIEF	the EEPROM memory	I don key i			
	THE LEFTON MEMORY				

In error conditions, the instrument provides an output power as programmed on par. "OPE" and activates the desired alarms, if the relative parameters "ALni" have been programmed = yES.

6.2 - CLEANING

We recommend cleaning of the instrument with a slightly wet cloth using water and not abrasive cleaners or solvents which may damage the instrument.

6.3 - GUARANTEE AND REPAIRS

The instrument is under warranty against manufacturing flaws or faulty material, that are found within 12 months from delivery date. The guarantee is limited to repairs or to the replacement of the instrument. The eventual opening of the housing, the violation of the instrument or the improper use and installation of the product will bring about the immediate withdrawal of the warranty's effects. In the event of a faulty instrument, either within the period of warranty, or further to its expiry, please contact our sales department to obtain authorisation for sending the instrument to our company. The faulty product must be shipped to TECNOLOGIC with a detailed description of the faults found, without any fees or charge for Tecnologic, except in the event of alternative agreements.

7 - TECHNICAL DATA

7.1 - ELECTRICAL DATA

Power supply: 12 VAC/VDC, 24 VAC/VDC, 100.. 240 VAC +/- 10%

Frequency AC: 50/60 Hz

Power consumption: 4 VA approx.

Input/s: 1 input for temperature probes: tc J,K,S ; infrared sensors TECNOLOGIC IRS J e K; RTD Pt 100 IEC; PTC KTY 81-121 (990 Ω @ 25 °C); NTC 103AT-2 (10K Ω @ 25 °C) or mV signals 0...50 mV, 0...60 mV, 12 ...60 mV or normalized signals 0/4...20 mA, 0..1 V, 0/1...5 V , 0/2...10 V.

Normalized signals input impedance: 0/4..20 mA: 51 Ω ; mV and V: 1 M Ω

Output/s: Up to 2 outputs. Relay SPDT (8 A-AC1, 3 A-AC3 / 250 VAC); or in tension to drive SSR (8mA/ 8VDC).

Auxiliary supply output: 10 VDC / 20 mA Max.

Electrical life for relay outputs: 100000 operat.

Installation category: II

Measurement category: I

<u>Protection class against electric shock:</u> Class II for Front panel <u>Insulation:</u> Reinforced insulation between the low voltage part (power supply 115 / 230 V and relay outputs) and front panel; Reinforced insulation between the low voltage section (Supply 115 / 230 V and relay outputs) and the extra low voltage section (input,

SSR outputs); Reinforced between power supply and relay; No Overall accuracy: +/- 0,5 % fs (tc S: +/- 1 % fs) insulation between supply 12 V and input. No insulation between Sampling rate: 130 ms. input and SSR outputs.

7.2 - MECHANICAL DATA

Housing: Self-extinguishing plastic, UL 94 V0 Dimensions: 33 x 75 mm, depth 64 mm

Weight: 110 g approx.

Mounting: Flush in panel in 29 x 71 mm hole Connections: 2,5 mm² screw terminals block

Degree of front panel protection: IP 65 mounted in panel with gasket

Pollution situation: 2

Operating temperature: 0 ... 50 °C

Operating humidity: 30 ... 95 RH% without condensation

Storage temperature: -10 ... +60 °C

7.3 - MECHANICAL DIMENSIONS, PANEL CUT-OUT AND **MOUNTING [mm]**

7.4 - FUNCTIONAL FEATURES

Control: ON/OFF, ON/OFF Neutral Zone, PID single Action, PID double action.

Measurement range: according to the used probe (see range table) Display resolution: according to the probe used 1/0,1/0,01/0,001

Display: 4 Digit Red h 12 mm

Compliance: ECC directive EMC 2004/108/CE (EN 61326), ECC

directive LV 2006/95/CE (EN 61010-1) Approvals: C-UL (file n. E206847)

"SEnS" = 2.10		

7.6 - INSTRUMENT ORDERING CODE

TLK38 a b c d ee f

a: POWER SUPPLY

F = 12 VAC/VDC

L = 24 VAC/VDC

H = 100... 240 VAC

b: INPUT

C = thermocouples (J, K, S, I.R), mV, thermoresistances (Pt100)

E = thermocouples (J, K, S, I.R.), mV, thermistors (PTC, NTC)

I = normalized signals 0/4..20 mA

V = normalized signals 0..1 V, 0/1..5 V, 0/2..10 V.

c: OUTPUT OUT1

R = Relay

O = VDC for SSR

d: OUTPUT OUT2

R = Relay

O = VDC for SSR

- = None

ee: SPECIAL CODES

f: SPECIAL VERSIONS

TLK 38 PASSWORD = 381
