1 - INSTRUMENT DESCRIPTION

1.1 - GENERAL DESCRIPTION

TLK 32 is a "single loop" digital microprocessor-based controller, with ON/OFF, Neutral Zone ON/OFF, PID single action, PID dual This manual contains the information necessary for the product to action (direct and reverse) control and with AUTO-TUNING FAST be installed correctly and also instructions for its maintenance and function, SELF-TUNING function and automatic calculation of the

The PID control has a particular algorithm with TWO DEGREES OF Though this manual has been issued with the greatest care, FREEDOM that optimises the instrument's features independently in

Furthermore, the instrument allows for 2 digital inputs and RS485 The same applies to each person or Company involved in the serial communication using MODBUS-RTU communication protocol and a transmission speed up to 38.400 baud.

The process value is visualized on 4 red display, the Set value is

The instrument provides for the storage of 4 Set Points and can have up to 4 outputs: relay type or can drive solid state relays type

Depending on the model required the input accept:

IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), the visualisation of the last Set Point, or alternatively, if no key is Thermoresistances PT100.

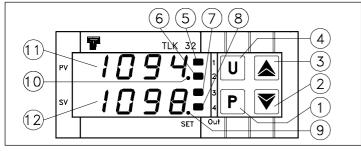

E: Thermocouples temperature probes (J,K,S and TECNOLOGIC functioning automatically. IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), Thermistors PTC and NTC.

I: normalized analogue signals 0/4..20 mA

V: normalized analogue signals 0..1 V, 0/1..5 V, 0/2..10 V

Other important available functions are: Loop-Break Alarm function, possible to enter into the main selection menu. reaching of the Set Point at controlled speed, ramp and dwell Using the "UP" or DOWN" keys, it is then possible to roll over the function, Soft-Start function, protection compressor function for selections: neutral zone control, parameters protection on different levels.

1.2 - FRONT PANEL DESCRIPTION

- to confirm selection.
- 2 Key DOWN: This is used to decrease the values to be set and to select the parameters. If the key is held down, the user returns to the previous programming level until he exits the programming mode. Outside the programming mode it permits visualisation of the current measured by the TAHB input.
- 3 Key UP: This is used to increase the values to be set and to select the parameters. If the key is held down, the user returns to the previous programming level until he exits the programming mode. Outside the programming mode it permits visualisation of the output control power.
- 4 Key U: This is a key with a function programmable by par. "USrb". It can be set to: Activate Auto-tuning and Self-tuning functions, swap the instrument to manual control, silence the alarm, change the active Set Point, deactivate control.

5 - Led OUT1 : indicates the state of output OUT1

6 - Led OUT2: indicates the state of output OUT2

7 - Led OUT3: indicates the state of output OUT3

8 - Led OUT4: indicates the state of output OUT4

9 - Led SET: when flashing, it indicates access to the programming

10 - Led AT/ST: indicates that the Self-tuning function is activated (light on) or that Auto-tuning (flashing) is in progress.

11 - Display PV: It normally indicates the process value

12 - Display SV: It normally indicates the active Set value, however it can be programmed, on par. "diSP", to visualize other values.

2 - PROGRAMMING

2.1 - FAST PROGRAMMING OF THE SET POINT

This procedure permits rapid programming of the active Set Point and possibly the alarm thresholds (see par 2.3)

Push key "P", then release it and the display will visualise "SP n" (where n is the number of the Set Point active at that moment) and the programmed value.

Will be possible to select the group of parameters to be modified.

Once the desired group of parameters has been selected, the code the programmed value.

To modify the value, press "UP" key to increase it or the "DOWN" key to decrease it.

These keys change the value one digit at a time but if they are pressed for more than one second, the value increases or decreases rapidly and, after two seconds in the same condition, the changing speed increases in order to allow the desired value to be reached rapidly.

Once the desired value has been reached, by pushing key P it is possible to exit by the fast programming mode or it is possible to visualise the alarm thresholds (see par. 2.3).

C: Thermocouples temperature probes (J,K,S and TECNOLOGIC To exit the fast Set programming it is necessary to push key P, after pressed for approx. 15 seconds, the display will return to normal

2.2 - SELECTION OF THE CONTROL STATE AND PARAMETER **PROGRAMMING**

By pushing key "P" and holding it down for approx. 2 sec. it is

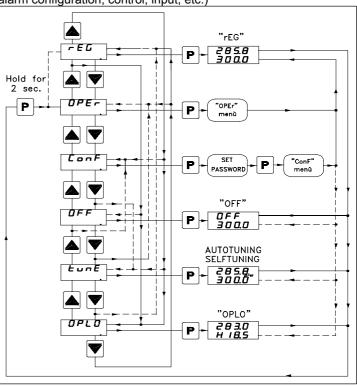

"OPEr"	to enter into the operating parameters menu
"ConF"	to enter into the configuration parameters menu
"OFF"	to swap the regulator into the OFF state
"rEG"	to swap the regulator into the automatic control state
"tunE"	to activate the Auto-tuning or Self-tuning function
"OPLO"	to swap the regulator to the manual control state and
	therefore to program the % control value using the
	"UP" and "DOWN" keys

Once the desired item has been selected, push key "P" to confirm. Selecting "OPEr" and "ConF" gives the possibility of accessing other menus containing additional parameters and more precisely:

"OPEr" - Operating parameters Menu: this normally contains the Set Point parameters but it can contain all the desired parameters (see par. 2.3).

1 - Key P: This is used to access the programming parameters and "ConF" - Configuration parameters Menu: this contains all the operating parameters and the functioning configuration parameters

(alarm configuration, control, input, etc.)

To enter the menu "OPEr", select the option "OPEr" and press the key "P".

The display SV will now show the code identifying the first group of parameters (" JSP ") and by pressing the "UP" and "DOWN" keys it

identifying the first parameter of the selected group will be visualised by pushing the "P" key.

Again using the "UP" and "DOWN" keys, it is possible to select the desired parameter and, if the key "P" is pressed, the display will show the parameter's code and its programming value, which can be modified by using the "UP" or "DOWN" keys.

Once the desired value has been programmed, push key "P" once more: the new value will be memorised.

By using the "UP" or "DOWN" keys, it is then possible to select a new parameter (if present) and modify it as described above.

To select another group of parameters, keep the "UP" or "DOWN" - By using the digital input 1 suitably programming par. "diF" ("diF" = visualise the code of the group of parameters.

possible to select a new group (if present).

To exit the programming mode, no key should be pressed for approx. 20 seconds, or keep the "UP" or "DOWN" pressed until exit state it was in when it was last switched off. from the programming mode is obtained.

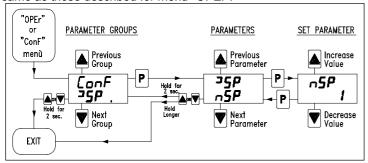

To enter the menu "ConF" a PASSWORD is required.

reported on the last page of this manual and push key "P".

If an incorrect password is entered, the instrument returns to the The range of the power values goes from H100 (100% of the output previous control state.

If the password is correct, the display will visualise the code direct action). identifying the first group of parameters (" 1SP") and with keys "UP" CONTROL OFF (OFF) - The instrument can be swapped into the and "DOWN" it will be possible to select the desired group of parameters

same as those described for menu "OPEr".

2.3 - PARAMETERS PROGRAMMING LEVELS

The menu "OPEr" normally contains the parameters used to The active Set point can be selected: program the Set Point; however it is possible to make all desired - by parameter "SPAt" in the group of parameters " ISP ". parameters appear or disappear on this level, by following this - by key "U" if par. "USrb" = CHSP procedure:

Enter the menu "ConF" and select the parameter to be made - Automatically between SP1 and SP2 if a time "dur.t" (see par. 4.8) programmable or not programmable in the menu "OPEr".

Once the parameter has been selected, if the LED SET is switched Set Points "SP1", "SP2", "SP3", "SP4" will be visible depending on off, this means that the parameter is programmable only in the the maximum number of Set Points selected on par. "nSP" and they menu "ConF", if instead the LED is on, this means that the can be programmed with a value that is between the value parameter is also programmable in the menu "OPEr".

To modify the visibility of the parameter, push key "U": the LED SET "SPHL". will change its state indicating the parameter accessibility level (on = Note : in all the following examples the Set point is indicated as menu "OPEr" and "ConF"; off = menu "ConF" only).

The active Set Point and the alarm thresholds will only be visible on selected as active. the Set Point fast programming level (described in par. 2.1) if the relative parameters are programmed to be visible (i.e. if they are present in the menu "OPEr").

The possible modification of these Sets, with the procedure described in par. 2.1, is instead subordinate to what is programmed in par. "Edit" (contained in the group " PAn ").

This parameter can be programmed as:

=SE: The active Set Point can be modified while the alarm thresholds cannot be modified.

=AE: The active Set Point cannot be modified while the alarm thresholds can be modified

=SAE : Both the active Set Point and the alarm thresholds can be modified

be modified.

2.4 - CONTROL STATES

The controller can act in 3 different ways: automatic control (rEG), control off (OFF) and manual control (OPLO).

The instrument is able to pass from one state to the other:

- by selecting the desired state from the main selection menu suing the keyboard.
- By using the key "U" on the keyboard; suitably programming par. "USrb" ("USrb" = tunE; "USrb" = OPLO; "USrb" = OFF) it is possible to pass from "rEG" state to the state programmed on the parameter and vice versa.

- key pressed for approx. 2 sec., afterwards the display will return to = OFF) it is possible to pass from "rEG" state to the state OFF and vice versa.
- Release the key and by using the "UP" and "DOWN" keys, it will be Automatically (the instrument swaps into "rEG" state at the and of the auto-tuning execution)

When switched on, the instrument automatically reassumes the

AUTOMATIC CONTROL (rEG) - Automatic control is the normal functioning state of the controller.

At this request, enter, using keys "UP" and "DOWN", the number During automatic control it is possible to visualize the control power on the display by pushing key "UP".

power with reverse action) to C100 (100% of the output power with

"OFF" state, i.e. the control and the relative outputs are deactivated. The alarm outputs are instead working normally.

The programming and exit modes for the "ConF" menu are the BUMPLESS MANUAL CONTROL (OPLO) - By means of this option it is possible to manually program the power percentage given as output by the controller by deactivating automatic control.

> When the instrument is swapped to manual control, the power percentage is the same as the last one supplied and can be modified using the "UP" and "DOWN" keys.

> As in the case of automatic control, the programmable values range from H100 (+100%) to C100 (-100%).

To return to automatic control, select "rEG" in the selection menu.

2.5 - ACTIVE SET POINT SELECTION

This instrument permits pre-programming of up to 4 different Set points ("SP1", "SP2", "SP3", "SP4") and then selection of which one must be active.

The maximum number of Set points is determined by the par. "nSP" located in the group of parameters " 1SP ".

- by the digital inputs if diF" = CHSP, = SP1.2, =SP1.4 or = HE.Co
- has been programmed.

programmed on par. "SPLL" and the one programmed on par.

"SP", however the instrument will act according to the Set point

3 - INFORMATION ON INSTALLATION AND USE

3.1 - PERMITTED USE

The instrument has been projected manufactured as a measuring and control device to be used according to EN61010-1 for the altitudes operation until 2000 ms.

The use of the instrument for applications not expressly permitted by the above mentioned rule must adopt all the necessary protective measures.

The instrument CANNOT be used in dangerous environments =SAnE : Both the active Set Point and the alarm thresholds cannot (flammable or explosive) without adequate protection.

The installer must ensure that EMC rules are respected, also after the instrument installation, if necessary using proper filters.

Whenever a failure or a malfunction of the device may cause dangerous situations for persons, thing or animals, please remember that the plant has to be equipped with additional devices which will guarantee safety.

3.2 - MECHANICAL MOUNTING

The instrument, in case 33 x 75 mm, is designed for flush-in panel mounting.

Make a hole 29 x 71 mm and insert the instrument, fixing it with the provided special bracket.

We recommend that the gasket is mounted in order to obtain the front protection degree as declared. Avoid placing the instrument in environments with very high humidity levels or dirt that may create condensation or introduction of conductive substances into the 4.1 - MEASURING AND VISUALIZATION instrument

Ensure adequate ventilation to the instrument and avoid installation group "InP". in containers that house devices which may overheat or which may Depending on the model required the input accept: cause the instrument to function at a higher temperature than the c. Thermocouples temperature probes (J,K,S and TECNOLOGIC one permitted and declared.

Connect the instrument as far away as possible from sources of electromagnetic disturbances such as motors, power relays, relays, solenoid valves, etc.

3.3 - ELECTRICAL CONNECTION

Carry out the electrical wiring by connecting only one wire to each terminal, according to the following diagram, checking that the power supply is the same as that indicated on the instrument and that the load current absorption is no higher than the maximum electricity current permitted.

As the instrument is built-in equipment with permanent connection inside housing, it is not equipped with either switches or internal devices to protect against overload of current: the installation will include a two-phase circuit-breaker, placed as near as possible to the instrument, and located in a position that can easily be reached (4.20) by the user and marked as instrument disconnecting device which interrupts the power supply to the equipment.

It is also recommended that all the electrical circuits connected to the instrument must be protect properly, using devices (ex. fuses) proportionate to the circulating currents.

It is strongly recommended that cables with proper insulation, according to the working voltages and temperatures, be used.

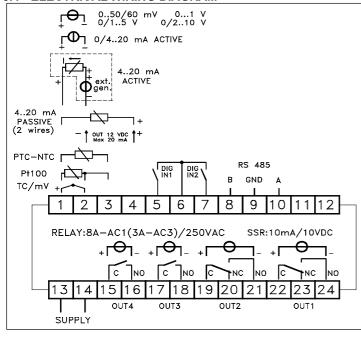

Furthermore, the input cable of the probe has to be kept separate from line voltage wiring. If the input cable of the probe is screened, it (°C, °F) and, through par. "dP" (Pt100, PTC and NTC only) the has to be connected to the ground with only one side.

For the electrical supply of the instrument it's recommended to use an external transformer TCTR, or with equivalent features, and to input signals, it is first necessary to program the desired resolution use only one transformer for each instrument because there is no insulation between supply and input.

We recommend that a check should be made that the parameters are those desired and that the application functions correctly before the value that the instrument must visualise at the end of the scale connecting the outputs to the actuators so as to avoid (20 mA, 50 mV, 60 mV, 5 V or 10 V). malfunctioning that may cause irregularities in the plant that could The instrument allows for measuring calibration, which may be used cause damage to people, things or animals.

Tecnologic S.p.A. and its legal representatives do not assume using par. "OFSt" and "rot". any responsibility for any damage to people, things or animals Programming par. "rot"=1,000, in par. "OFSt" it is possible to set a deriving from violation, wrong or improper use or in any case positive or negative offset that is simply added to the value read by not in compliance with the instrument's features.

3.4 - ELECTRICAL WIRING DIAGRAM

4 - FUNCTIONS

All the parameters referring measurements are contained in the

IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), Thermoresistances PT100.

E: Thermocouples temperature probes (J,K,S and TECNOLOGIC IRS Infrared sensors), mV signals (0..50/60 mV, 12..60 mV), Thermistors PTC and NTC.

I : normalized analogue signals 0/4..20 mA

V: normalized analogue signals 0..1 V, 0/1..5 V, 0/2..10 V

Depending on the model, using par. "SEnS", it's possible to select the type of input probe, which can be:

- for thermocouples J (J), K (CrAL), S (S) or for infrared sensors serie TECNOLOGIC IRTC1 with linearization J (Ir.J) or K (Ir.CA)
- for thermoresistances Pt100 IEC (Pt1) or thermistors PTC KTY81-121 (Ptc) or NTC 103AT-2 (ntc)
- for normalised signals in current 0..20 mA (0.20) or 4..20 mA
- for normalised signals in tension 0..1 V (0.1), 0..5 V (0.5), 1..5 V (1.5), 0..10 V (0.10) or 2..10 V (2.10).
- for normalised signals in tension 0..50 mV (0.50), 0..60 mV (0.60), 12..60 mV (12.60).

We recommend to switch on and off the instrument when these parameters are modified, in order to obtain a correct measuring.

For the instruments with input for temperature probes (tc, rtd) it's possible to select, through par. "Unit", the unit of measurement desired resolution (0=1°; 1=0,1°).

Instead, with regards to the instruments with normalised analogue on par. "dP" (0=1; 1=0,1; 2=0,01; 3=0,001) and then, on par. "SSC", the value that the instrument must visualise at the beginning of the scale (0/4 mA, 0/12 mV, 0/1 V o 0/2 V) and, on par. "FSC".

to recalibrate the instrument according to application needs, by

the probe before visualisation, which remains constant for all the measurements.

If instead, it is desired that the offset set should not be constant for all the measurements, it is possible to operate the calibration on any two points.

In this case, in order to decide which values to program on par. "OFSt" and "rot", the following formulae must be applied :

"OFSt" = $D2 - ("rot" \times M2)$ "rot" = (D2-D1) / (M2-M1)

M1 =measured value 1

D1 = visualisation value when the instrument measures M1

M2 =measured value 2

D2 = visualisation value when the instrument measures M2 It then follows that the instrument will visualise:

DV = MV x "rot" + "OFSt"

where: DV = visualised value MV= measured value

Example 1: It is desired that the instrument visualises the value effectively measured at 20° but that, at 200°, it visualises a value lower than 10° (190°).

Therefore: M1=20; D1=20; M2=200; D2=190

"rot" = (190 - 20) / (200 - 20) = 0,944

"OFSt" = 190 - (0,944 x 200) = 1,2

Example 2: It is desired that the instrument visualises 10° whilst the value actually measured is 0°, but, at 500° it visualises a 50° higher value (550°).

Therefore: M1=0; D1=10; M2=500; D2=550

"rot" = (550 - 10) / (500 - 0) = 1,08

By using par. "FiL" it is possible to program time constant of the software filter for the input value measured, in order to reduce noise sensitivity (increasing the time of reading).

In case of measurement error, the instrument supplies the power as programmed on par. "OPE".

This power will be calculated according to cycle time programmed for the PID controller, while for the ON/OFF controllers the cycle time is automatically considered to be equal to 20 sec. (e.g. In the event of probe error with ON/OFF control and "OPE"=50, the control output will be activated for 10 sec., then it will be deactivated for 10 sec. and so on until the measurement error remains.).

By using par. "InE" it is also possible to decide the conditions of the input error, allowing the instrument to give the power programmed on par. "OPE" as output.

The possibilities of par. "InE" are:

- = Or : the condition occurs in case of over-range or probe breakage = Ur : the condition occurs in case of under-range or probe breakage
- = Our : the condition occurs in case of over-range or under-range or probe breakage

Using par. "diSP", located in the group "PAn", it is possible to set normal visualization of the display SV which can be the active Set Point (SP.F), the Set Point operating when there are active ramps (SP.o), the alarm threshold AL1, 2 or 3 (AL1, AL2 or AL3) or can be switched OFF (OFF).

4.2 - OUTPUTS CONFIGURATION

The instrument's outputs can be programmed by entering the group of parameters "Out, where the relative parameters "O1F", "O2F" ,"O3F", "O4F" (depending on the number of outputs available on the instrument) are located.

The outputs can be set for the following functions:

- Main control output (1.rEG)
- Secondary control output (2.rEG)
- Alarm output normally open (ALno)
- Alarm output normally closed (ALnc)
- Alarm output normally closed with led reverse indication (ALni)
- Output deactivated (OFF)

The coupling outputs number outputs - number alarms can be made in the group referring to the alarm to the alarm ("IAL1","IAL2" o "JAL3").

4.3 - ON/OFF CONTROL (1rEG)

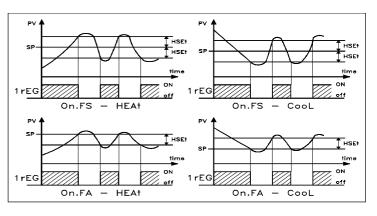

All the parameters referring to the ON/OFF control are contained in the group "1rEG".

This type of control can be obtained by programming par. "Cont" = On.FS or = On.FA and works on the output programmed as 1.rEG, depending on the measure, on the active Set Point "SP", on the functioning mode "Func" and on the hysteresis "HSEt".

hysteresis if "Cont" = On.FS or with asymmetrical hysteresis if compressor "short cycles". "Cont" = On.Fa.

The control works in the following way: in the case of reverse action, or heating ("FunC"=HEAt), it deactivates the output, when the process value reaches [SP + HSEt] in case of symmetrical This protection permits to avoid the output activation for a time activated again when the process value goes below value [SP -

Vice versa, in case of direct action or cooling ("Func"=CooL), it the last output deactivation. deactivates the output, when the process value reaches [SP - HSEt] Obviously, whether during the time delay caused by the compressor in case of symmetrical hysteresis, or [SP] in case of asymmetrical protection function, the regulator request should stop, the output hysteresis and is activated again when the process value goes activation foreseen after time "CPdt" would be erased. above value [SP + HSEt].

4.4 - NEUTRAL ZONE ON/OFF CONTROL (1rEG - 2rEG)

All the parameters referring to Neutral Zone ON/OFF control are contained in the group "'rEG".

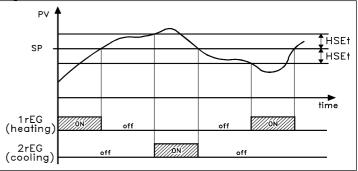

This type of control can be obtained when 2 outputs are programmed respectively as 1rEG and 2rEG and the par. "Cont" = nr .

The Neutral Zone control is used to control plants in which there is an element which causes a positive increase (ex. Heater, humidifier, etc.) and an element which causes a negative increase (ex. Cooler, de-humidifier, etc).

The control functions works on the programmed outputs depending on the measurement, on the active Set Point "SP" and on the hysteresis "HSEt".

The control works in the following way: it deactivates the outputs when the process value reaches the Set Point and it activates the output 1rEG when the process value goes below value [SP - HSEt], or it activates the output 2rEG when the process value goes above [SP + HSEt].

Consequently, the element causing a positive increase has to be connected to the output programmed as 1rEG while the element causing a negative increase has to be connected to the output programmed as 2rEG.

If 2rEG output is used to control compressor is possible to use the The instrument carries out an ON/OFF control with symmetric "Compressor Protection" function that has the meaning to avoid

> This function allows a control by time on the output 2rEG activation, independently by the temperature control request.

The protection is a "delayed after deactivation" type.

hysteresis, or [SP] in case of asymmetrical hysteresis and is then programmable on par. "CPdt" (expressed in sec.); the output activation will occurs only after the elapsing of time "CPdt".

The time programmed on parameter "CPdt" is counted starting from

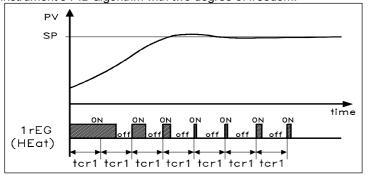

The function is not active programming "CPdt" =OFF.

The led relative to 2rEG output blinks during the phases of output activation delay, caused by "Compressor Protection" function.

4.5 - SINGLE ACTION PID CONTROL (1rEG)

All the parameters referring to PID control are contained in the group "1rEG".

The Single Action PID control can be obtained by programming par."Cont" = Pid and works on the output 1rEG depending on the active Set Point "SP", on the functioning mode "Func" and on the "Int" - Integral Time instrument's PID algorithm with two degree of freedom.

In order to obtain good stability of the process variable, in the event automatic tuning of the PID controller. of fast processes, the cycle time "tcr1" has to have a low value with The AUTO-TUNING function permits the calculation of thePID a very frequent intervention of the control output.

In this case use of a solid state relay (SSR) is recommended for driving the actuator.

The Single Action PID control algorithm foresees the setting of the following parameters:

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1rEG

"Int" - Integral Time

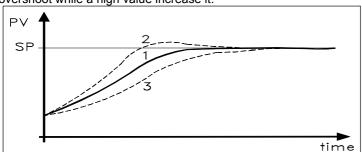

"rS" - Manual Reset (if "Int =0 only)

"dEr" - Derivative Time

"FuOC" - Fuzzy Overshoot Control

This last parameter allows the variable overshoots at the start up of "FuOC" - Fuzzy Overshoot Control the process or at the changing of the Set Point to be avoided.

Please remember that a low value on this parameter reduces the overshoot while a high value increase it.

- 1: Valore "FuOC" OK
- 2: Valore "FuOC" troppo alto
- 3: Valore "FuOC" troppo basso

4.6 - DOUBLE ACTION PID CONTROL (1rEG - 2rEG)

All the parameters referring to PID control are contained in the group "IrEG".

The Double Action PID control is used to control plants where there is an element which causes a positive increase (ex. Heating) and an element which causes a negative increase (ex. Cooling).

This type of control can be obtained when 2 outputs are programmed respectively as 1rEG and 2rEG and the par. "Cont" = Pid.

The element causing a positive increase has to be connected to the output programmed as 1rEG while the element causing a negative increase has to be connected to the output programmed as 2rEG. The Double Action PID control works on the outputs 1rEG and 2rEG

depending on the active Set Point "SP" and on the instrument's PID algorithm with two degrees of freedom.

In order to obtain good stability of the process variable, in case of fast processes, the cycle times "tcr1" and "tcr2" have to have a low 8) Activate the Auto-tuning by selecting par. "tunE" in the main value with a very frequent intervention of the control outputs.

In this case use of solid state relays (SSR) to drive the actuators is

The Double Action PID control algorithm needs the programming of the following parameters:

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1rEG

"tcr 2" - Cycle time of the output 2rEG

"rS" - Manual Reset (if "Int =0 only)

"dEr" - Derivative Time

"FuOC" - Fuzzy Overshoot Control

"Prat" - Power Ratio or relation between power of the element controlled by output 2rEG and power of the element controlled by

If par. "Prat" = 0, the output 2rEG is disabled and the control behaves exactly as a single action PID controller, through output

4.7 - AUTOTUNING AND SELFTUNING FUNCTIONS

All the parameters referring to the AUTO-TUNING SELF-TUNING functions are contained in the group "1rEG".

The AUTO-TUNING and SELF-TUNING functions permit the

parameters by means of a FAST type tuning cycle and, at the end of this operation, the parameters are stored into the instrument's memory and remain constant during control.

The SELF-TUNING function (rule based "TUNE-IN") instead allows control monitoring and the continuous calculation of the parameters during control.

Both functions automatically calculate the following parameters :

"Pb" - Proportional Band

"tcr1" - Cycle time of the output 1rEG

"Int" - Integral Time

"dEr" - Derivative Time

and, for the Double Action PID control, also:

"tcr 2" - Cycle time of the output 2rEG

"Prat" - Ratio P 2rEG/ P 1rEG

To activate the AUTO-TUNING function proceed as follows:

- 1) Program and activate the desired Set Point.
- 2) Program par. "Cont" =Pid.
- 3) Program par. "Func" according to the process to be controlled through output 1rEG.
- 4) Program an output as 2rEG if the instrument controls a plant with double action
- 5) Program par. "Auto" as:
- "1" if auto-tuning is desired automatically, each time the instrument is switched on, on the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" =CooL) than [SP+ |SP/2|].
- "2" if auto-tuning is desired automatically, the next time the instrument is switched on, on the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" =CooL) than [SP+ |SP/2|], and once the tuning is finished, the par. "Auto" is automatically swapped to the OFF state
- "3" if manual auto-tuning is desired, by selecting par. "tunE" in the main menu or by correctly programming key "U" as "USrb" = tunE. In this case the auto-tuning starts without any control on the process value condition. It is recommended to use this option, starting the auto-tuning when the process value is as far as possible from the Set Point because, in order to feature the Auto-tuning FAST with its best performances, it is preferable to respect this
- "4" if it's desired to activate the autotuning automatically at the end of programmed Soft-Start cycle. The Autotuning will start at the condition that the process value is lower (with "Func" =HEAt) than [SP-|SP/2|] or higher (with "Func" =CooL) than [SP+|SP/2|].
- Exit from the parameter programming.
- 7) Connect the instrument to the controlled plant.
- menu (or by correctly programming key "U").

At this point the Auto-tuning function is activated and is indicated by the flashing led AT/ST.

The regulator carries out several operations on the connected plant in order to calculate the most suitable PID parameters.

If "Auto" = 1 or "Auto" = 2, and if, at the Auto-tuning start, the condition for the lower process value is not found (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" =CooL) than [SP+

|SP/2|], the display will show "ErAt" and the instrument will be swapped to normal control conditions according to the previously programmed parameters.

To make the error "ErAt" disappear, swap the instrument to the OFF control (OFF) and then turn it to automatic control (rEG).

The Auto-tuning cycle duration has been limited to 12 hours

If Auto-tuning is not completed within 12 hours, the instrument will show "noAt" on the display.

In case of probe error, the instrument automatically stops the cycle

The values calculated by Auto-tuning are automatically stored in the instrument's memory at the end of the correct PID parameters tunina.

Note: The instrument is already programmed in our factory to carry out auto-tuning at every instrument switch on ("Auto" = 1).

To activate the SELF-TUNING function proceed as follows

- 1) Program and activate the desired Set Point.
- 2) Program par. "Cont" =Pid.
- through output 1rEG.
- dual-action plant
- 5) Program par. "SELF" = yES
- 6) Exit from the parameter programming.
- 7) Connect the instrument to the controlled plant.
- 8) Activate Self-tuning selecting par. "tune" in the main menu (or the normal rating. (ex. for certain heating elements). by correctly programming key "U").

When the Self-tuning function is active, the led AT/ST is permanently lit up and all the PID parameters ("Pb", "Int", "dEr", etc.) are no longer visualized.

with the Self-tuning function activated, these functions will remain to automatic control at the elapsing of time "SSt". activated the next time it is switched on.

4.8 - REACHING OF THE SET POINT AT CONTROLLED SPEED found to be lower than the programmed one. AND AUTOMATIC SWITCHING BETWEEN TWO SET POINTS 2) If par. "St.P" = OFF and a value is set on par. "SSt", at the switch (RISE RAMP, FALL RAMP AND DWELL TIME)

All the parameters referring to the ramps functioning are contained in the group "1rEG".

It is possible to reach the set point in a predetermined time (in any case longer than the time the plant would naturally need). This could power calculated by the PID controller. be useful in those processes (heating or chemical treatments, etc.) where the set point has to be reached gradually, in a predetermined time

Once the instrument has reached the first Set Point (SP1) it is possible to have automatic switching to the second Set Point (SP2) after a set time, thus obtaining a simple automatic thermic cycle.

These functions are available for all the programmable controls (PID single and double action, ON/OFF and Neutral Zone ON/OFF).

The function is determined by the following parameters:

"SLor" - Gradient of rise ramp (Process value < Set point) expressed in unit/minute

"SLoF" - Gradient of fall ramp (Process value > Set point) expressed in unit/minute.

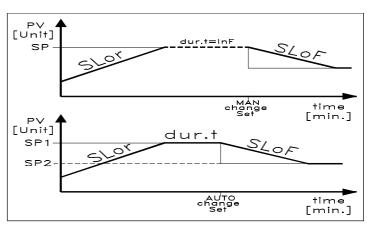

"dur.t" - Dwell time of Set Point SP1 before automatic switching to Set Point 2 SP2 (expressed in hrs. and min.).

The functions are deactivated when the relative parameters are =

When the Set Point value is changed or at switch on, the instrument alarm has to correspond to. automatically determines which of the two values "SLor" or "SLoF" it First of all it is necessary to configure the parameters relative to the has to use.

ramp function is active, this will not be carried out until the tuning to the desired output as follows : cycle has been completed.

It is therefore recommended that Auto-tuning be started avoiding while it is OFF when the alarm is not active activating the ramp function and, once the tuning is finished, = ALnc if the alarm output has to be ON when the alarm is not deactivate Auto-tuning ("Auto" = OFF), program the desired ramps active, while it is OFF when the alarm is active. and, if it automatic tuning is desired, enable the Self-tuning function.

Examples with starts from values lower than SP and with decreasing of SP.

4.9 - SOFT-START FUNCTION

3) Program par. "Func" according to the process to be controlled All the parameters referring to the Soft -Start functioning are contained in the group "1rEG".

4) Program an output as 2rEG if the instrument controls a The Soft-Start function only works through PID control and allows the limitation of control power when the instrument is switched on, for a programmable period of time.

> This is useful when the actuator, driven by the instrument, may be damaged excess power supplied when the application is not yet in

The function depends on the following parameters:

"St.P" - Soft-Start power

"Sst" - Soft-Start time (expressed in hh.mm)

The possible function modes are the following:

1) If both parameters are programmed with values other than OFF, To stop the Auto-tuning cycle or deactivate the Self-tuning function when switched on the instrument gives an output power as select one of the control types: "reG", "OPLO" or "OFF" from the programmed on par. "St.P" for the time programmed on par. "St". menu "SEL". If the instrument is switched off during Auto-tuning or Practically, the instrument works in manual condition and switches

It is advisable not to program a power "St.P" that is too high as the function is not deactivated when the automatic control power is

on, the power calculated by the PID controller is divided by the time "SSt", in order to calculate a ramp. The output power starts from 0 and is progressively increased, depending on the calculated ramp, until the "SSt" time is reached or until the power overcomes the

To disable the Soft-Start function simply program par. "Sst" = OFF Whenever, a measurement errors occurs during the Soft-Start execution, the function is interrupted and the instrument gives an output power as programmed on par. "OPE".

If the measurement is restored, the Soft-Start is still deactivated.

If it's desired to activate the Autotuning with Soft-Start set par. "Auto"=4.

The Autotuning will start automatically at the end of programmed Soft-Start cycle at the condition that the process value is lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" =CooL) than [SP+ |SP/2|].

4.10 - ALARM FUNCTION (AL1, AL2, AL3)

4.10.1 - ALARM OUTPUT CONFIGURATION

The alarms (AL1, AL2, AL3) depend on the process value and before setting them to work, it is necessary to know which output the

outputs required as alarm ("O1F", "O2F", "O3F", "O4F"), in the Note: In case of PID control, if Auto-tuning is desired whilst the group of parameters "Out", programming the parameter relating

= ALno if the alarm output has to be ON when the alarm is active,

= ALni if the alarm output has to be ON when the alarm is not LHdE = DEVIATION BAND ALARM: The alarm is activated when active, while it is OFF when the alarm is active but with reverse led the process value goes below the value [SP + ALnL] or goes above indication (led ON= alarm OFF).

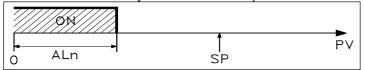

Note: In the following examples the alarm's number is generally indicated as n

Access the group "IALn", relating to the alarm to be set and program which output the alarm signal must be sent to on par. "OALn".

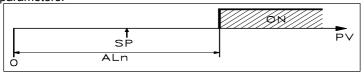

The alarm functioning is instead defined by parameters:

- "ALnt " ALARM TYPE
- "Abn" ALARM CONFIGURATION
- "ALn" ALARM THRESHOLD
- MINIMUM SET OF ALn ALARM THRESHOLD (for low or high descriptions:
- MAXIMUM SET OF ALn ALARM THRESHOLD (for low or high "Abn". alarm)
- "HALn" ALARM HYSTERESIS
- "ALnd" ALARM ACTIVATION DELAY (in sec.)
- "ALni" ALARM BEHAVIOUR IN THE **EVENT** MEASUREMENT ERROR
- "ALnt" ALARM TYPE: the alarm output can behave in six conditions and then back in alarm conditions. different ways.

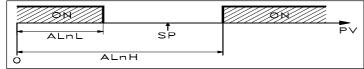

LoAb = ABSOLUTE LOW ALARM: The alarm is activated when the process value goes below the alarm threshold set on parameter "ALn". With this mode is possible to program the minimum and the maximum set of "ALn" by "ALnL" and "ALnH" parameters.

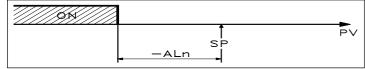

HiAb = ABSOLUTE HIGH ALARM: The alarm is activated when the process value goes higher than the alarm threshold parameter "ALn". With this mode is possible to program the ALARM DELAY: the alarm output may behave in two different ways minimum and the maximum set of "ALn" by "ALnL" and "ALnH" parameters.

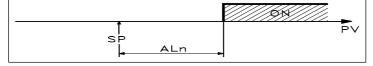

LHAb = ABSOLUTE BAND ALARM: The alarm is activated when the process value goes under the alarm threshold set on parameter "ALnL" or goes higher than the alarm threshold set on parameter "ALnH"

LodE = DEVIATION LOW ALARM: The alarm is activated when the process value goes below the value [SP + ALn]. With this mode is possible to program the minimum and the maximum set of "ALn" by "ALnL" and "ALnH" parameters.

process value goes above the value [SP + ALn]. With this mode is possible to program the minimum and the maximum set of "ALn" + 0 = ALARM NOT AKNOWLEDGED: The alarm always remains by "ALnL" and "ALnH" parameters.

than the value [SP + ALnH]

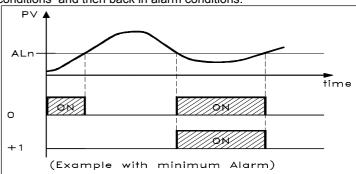

"Abn" - ALARM CONFIGURATION: This parameter can assume a value between 0 and 15.

The number to be set, which will correspond to the function desired, "ALnL" - LOW ALARM THRESHOLD (for band alarm) OR is obtained by adding the values reported in the following

ALARM BEHAVIOUR AT SWITCH ON: the alarm output may "ALnH" - HIGH ALARM THRESHOLD (for band alarm) OR behave in two different ways, depending on the value added to par.

- +0 = NORMAL BEHAVIOUR: The alarm is always activated when there are alarm conditions.
- +1 = ALARM NOT ACTIVATED AT SWITCH ON: If, when switched OF on, the instrument is in alarm condition, the alarm is not activated. It will be activated only when the process value is in non-alarm

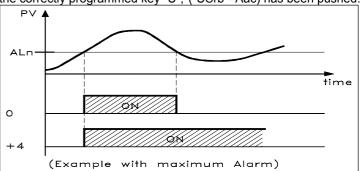

depending on the value added to par. "Abn".

- +0 = ALARM NOT DELAYED: The alarm is immediately activated when the alarm condition occurs.
- +2 = ALARM DELAYED: When the alarm condition occurs, delay counting begins, as programmed on par. "ALnd" (expressed in sec.) and the alarm will be activated only after the elapsing of that time.

ALARM LATCH: the alarm output may behave in two different ways depending on the value added to par. "Abn".

- + 0 = ALARM NOT LATCHED: The alarm remains active in alarm conditions only.
- + 4 = ALARM LATCHED: The alarm is active in alarm conditions and remains active even when these conditions no longer exist, until the correctly programmed key "U", ("USrb"=Aac) has been pushed.

HidE = DEVIATION HIGH ALARM: The alarm is activated when the ALARM AKNOWLEDGEMENT: the alarm output may behave in two different ways depending on the value added to par. "Abn".

- active in alarm conditions.
- + 8 = ALARM AKNOWLEDGED: The alarm is active in alarm conditions and can be deactivated by key "U" if properly programmed ("USrb"=ASi), and also if alarm conditions still exist.

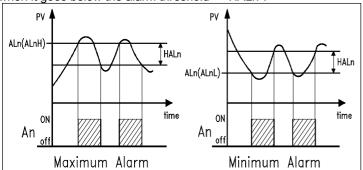

- ALARM ACTIVATION IN CASE OF MEASUREMENT **ERROR:** This allows one to establish how the alarm have behave in

the event of a measurement error (yES=alarm active; no=alarm = OPLO : Pushing the key for 1 sec. at least, it is possible to swap deactivated).

4.10.2 - ALARMS HYSTERESIS

The alarm function depend s on alarm hysteresis (par. "HALn"), = ASi: Pushing the key for 1 sec. at least, it is possible to which works in asymmetric way.

In the event of low alarm, the alarm will be activated when the = CHSP: Pushing the key for 1 sec. at least, it is possible to select process value goes below the alarm threshold value and will be one of the 4 pre-programmed Set Points on rotation. deactivated when it goes above the alarm threshold + "HALn"; in = OFF: Pushing the key for 1 sec. at least, it is possible to swap case of high alarm, the alarm will be activated when the process from automatic control (rEG) to OFF control (OFF) and vice versa. value goes above the alarm threshold value and will be deactivated when it goes below the alarm threshold - "HALn".

For the band alarms, the example of the low alarm is applicable to the low threshold ("ALnL") while the example of the high alarm is applicable to the high threshold ("ALnH").

4.11 - LOOP BREAK ALARM FUNCTION

All the parameters referring to the Loop Break alarm function are contained in the group "IL bA" possible to select the OFF control (OFF).

Contained in the group "IL bA" contained in the group "1LbA".

The Loop Break alarm is available on all the instruments, which intervenes when, for any reason (short-circuit of a thermocouple, thermocouple inversion, load interruption), the loop control is interrupted.

First of all, it is necessary to establish to which output the alarm has to correspond.

To do this it is necessary to set the parameter relative to the output to be used ("O1F", "O2F", "O3F", "O4F") in the group "Out", = SP1.4: The following combination of the connected contacts to programming the parameter as:

- **= ALno** if the alarm output has to be ON when the alarm is active while it is OFF when the alarm is not active.
- = ALnc if the alarm output has to be ON when the alarm is not active while it is OFF when the alarm is active.
- **= ALni** if the alarm output has to be ON when the alarm is not active, while it is OFF when the alarm is active but with reverse led indication (led ON= alarm OFF).

to be addressed to on par. "OLbA",.

The Loop Break alarm is activated if the output power remains at the 100% of the value for the time programmed on par. "LbAt" (expressed in sec.).

To avoid false alarms, the value of this parameter has to be set considering the time the plant takes to reach the Set point when the measured value is a long distance from it (for example at the plant 4.14 - RS 485 SERIAL INTERFACE start-up).

On alarm intervention, the instrument visualizes the message "LbA" and behaves as in the case of a measurement error giving a group "InP").

checking the correct functioning of probe and actuator.

To exclude the Loop Break alarm, set "OLbA" = OFF.

4.12 - FUNCTIONING OF KEY "U"

The function of key "U" can be set through par. "USrb" contained in the group ""PAn".

The parameter can be programmed as:

= **noF**: no function

activate/deactivate Auto-tuning or Self-tuning

- from automatic control (rEG) to manual one (OPLO) and vice versa.
- = Aac : Pushing the key for 1 sec. at least, it is possible to acknowledge the alarm. (see par. 4.10.1)
- acknowledge an active alarm (see par. 4.10.1)

4.13 - DIGITAL INPUTS

The instrument can be equipped with 2 digital inputs.

The function of the digital inputs can be set through par. "diF" contained in the group ""InP".

The parameter can be programmed as:

= noF: no function

- = Aac : Closing the contact connected to the digital input 1 it is possible to acknowledge the alarm. (see par. 4.10.1)
- = ASi :Closing the contact connected to the digital input 1 it is possible to acknowledge an active alarm (see par. 4.10.1)
- **= HoLd** :Closing the contact connected to the digital input 1 there is the hold of the measure in that instant (P.A.: not the reading on the display, therefore the indication could settle with a proportional delay to the filter of measure). With the function hold the instrument operate the control in base to the memorized measure.

Reopening the contact the instrument come back to the normal acquisition of the measure.

- = OFF : Closing the contact connected to the digital input 1 it is
- input 1 it is possible to select one of the 4 pre-programmed Set Points on rotation.
- **= SP1.2** : Closing the contact connected to the digital input 1 it is possible to select as active the set point SP2. Reopening the contact is select as active the set point SP1. This function is possible only when "nSP" = 2, and when is selected it disables the selection of the active set through the parameter "SPAt" and

the two digital entries allows the activation of one of the 4 memorized set points.

DIG IN1	DIG IN2	SET POINT
off	off	SP1
on	off	SP2
off	on	SP3
on	on	SP4

Enter group "ILbA" and program which output the alarm signal has when this function is selected it disables the selection of the active set through the parameter "SPAt" and through the key U.

= HE.Co : Closing the contact connected to the digital input 1 it is possible to select as active the set point SP2 in "CooL" mode. Reopening the contact is select as active the set point SP1 in "HEAt" mode. This function is possible only when "nSP" = 2.

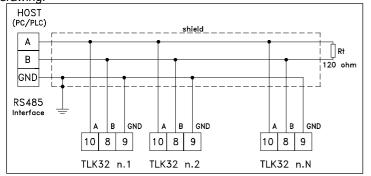

The instrument can be equipped with a RS 485 serial communication interface, by means of which it is possible to connect the regulator with a net to which other instruments power output as programmed on par. "OPE" (programmable in the regulators of PLC) are connected, all depending typically on a personal computer used as plant supervisor. Using a personal computer it is possible to acquire all the function information and to mode "OFF" and then re-program the automatic control ("rEG") after protocol adopted for TUCO in a fine familiary and to control ("rEG") after protocol adopted for TUCO in a fine familiary and the software several PLC and supervision programs available on the market (TLK series protocol manual is available on request).

The interface circuit allows the connection of up to 32 instruments on the same line.

To maintain the line in rest conditions a 120 Ohm resistance (Rt) must be connected to the end of the line.

The instrument is equipped with two terminals called A and B which have to be connected with all the namesake terminals of the net. = tunE : Pushing the key for 1 sec. at least, it is possible to For the wiring operation they must be interlaced with a double cable (telephonic type) and all the GND terminals must be connected to

the ground. Nevertheless, particularly when the net results very long 1) position both dip switch of KEY 01 in the **OFF** mode. or noised and being present potential differences between the GND terminals, it is advisable to adopt a screened cable wired as in the connector.

If the instrument is equipped with a serial interface, the parameters 2) connect the device to an instrument TLK having the same to be programmed are the following, all present in the parameters group "SEr":

"Add": Address of the station. Set a different number for each 3) verify that the instrument or the device are supplied station, from 1 to 255.

to 38400 baud. All the stations have to have the same transmission means that on the device it has not been downloaded any valid speed.

"PACS": Programming access. If programmed as "LoCL" this 5) if the les results green, press the button placed on the device. means that the instrument is only programmable from the keyboard, 6) observe the indication led: after having pressed the button, the if programmed as "LorE" it is programmable both from the led becomes red and therefore, at the end of the data transfer, it keyboards and serial line.

If an attempt is made to enter the programming from the keyboard $\frac{7}{2}$) now it is possible to disconnect the device. whilst a communication through the serial port is in progress the For additional info, please have a look at the KEY01 instruction instrument will visualise "buSy" to indicate the busy state.

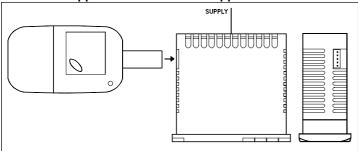

4.15 - PARAMETERS CONFIGURATION BY "KEY01"

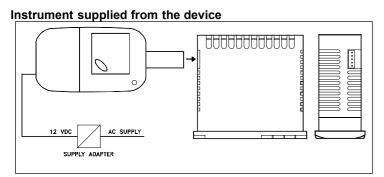

The instrument is equipped with a connector that allows the transfer from and toward the instrument of the functioning parameters Here following are described all the parameters available on the through the device **TECNOLOGIC KEY01** with **5 poles** connector.

instruments which need to have the same parameters configuration automatically disabled as unnecessary. or to keep a copy of the programming of an instrument and allow its rapid retransmission.

To use the device KEY01 it's necessary that the device or instrument are being supplied.

Instrument supplied and device not supplied

P.A.: For the instruments equipped with RS485 communication, it's indispensable that the parameter "PACS" is programmed = LorE.

To transfer the configuration of an instrument into the device (UPLOAD) it is necessary to proceed in the following way:

- 2) connect the device to the instrument TLK plugging the special
- 3) verify that the instrument or the device are supplied
- 4) observe the indication led on the device KEY 01: if it results green this means that a configuration is already loaded on the device while if it results green blinking or red blinking this means that it has not been loaded any valid configuration on the device .
- 5) press the button placed on the device.
- 6) observe the indication led: after having pressed the button, the led becomes red and therefore, at the end of the data transfer, it becomes green.
- 7) now it is possible to disconnect the device.
- To transfer the configuration loaded on the device onto an instrument of the same family (DOWNLOAD), it is necessary to proceed in the following way:
- 1) position both dip switch of KEY 01 in the **ON** mode.
- features of the one from which has been downloaded the desired configuration, plugging the special connector.
- 4) observe the indication led on the device KEY 01: it has to result "baud": Transmission speed (baud-rate), programmable from 1200 green, because if the led results green blinking or red blinking, this configuration and therefore it's useless to continue.

 - becomes green.

manual.

5 - PROGRAMMABLE PARAMETERS

instrument. Some of them could be not present or because they are This device it's mainly useable for the serial programming of the depending on the type of instrument or because they are

5.1 - PARAMETERS TABLE

5.2 - PARAMETERS DESCRIPTION

GROUP " ISP" (PARAMETERS RELATIVE TO THE SET POINT): These allow the setting of the control Sets and the Sets function modes.

nSP - NUMBER OF PROGRAMMABLE SET POINTS: This allows = Or: the condition occurs in case of over-range or probe breakage definition of the number of Set Points which will be programmed and = Ur : the condition occurs in case of under-range or probe stored (from 1 to 4).

SPAt - ACTIVE SET POINT : If more than one Set Point is stored, = Our : the condition occurs in case of over-range or under-range or this allows selection of the active Set Point.

SP1 - SET POINT 1: Value of the Set Point n. 1

SP3 - SET POINT 3: Value of the Set Point n. 3 (it appears if "nSP"

SP4 - SET POINT 4: Value of the Set Point n. 4 (it appears if "nSP" inputs operation mode as: =4 only)

SPLL – LOW SET POINT: Lower value programmable as Set Point SPHL - HIGH SET POINT: Higher value programmable as Set possible to acknowledge the alarm. (see par. 4.10.1) Point

variable measured by the probe.

the type of probe:

- sensors IRS serie with J (Ir.J) or K (Ir.CA) linearization.
- thermoresistances: Pt100 IEC (Pt1)
- thermistors PTC KTY81-121 (Ptc) or NTC 103AT-2 (ntc)
- normalized signals in current: 0..20 mA (0.20) or 4..20 mA (4.20)
- 12..60 mV (12.60), 0..1 V (0.1), 0..5 V (0.5), 1..5 V (1.5), 0..10 V Points on rotation. (0.10) or 2..10 V (2.10).

SSC - LOW SCALE LIMIT IN EVENT OF INPUT WITH V/I SIGNALS: This is the value the instrument has to visualise when the minimum value that can be measured on the scale (0/4 mA, 0/12 mV, 0/1 V or 0/2 V) is present at the output.

FSC - HIGH SCALE LIMIT IN EVENT OF INPUT WITH V/I SIGNALS: This is the value the instrument has to visualise when the maximum value that can be measured on the scale (20 mA, 50 mV, 60 mV, 1 V, 5 V or 10 V) is present at the input.

dP - NUMBER OF DECIMAL FIGURES: It permits to decide if the measuring resolution has to be 1 (0), 0.1 (1), 0.01 (2), 0.001 (3). In case of Pt100, PTC and NTC temperature probes the allowed resolutions are 1° (0) and 0.1° (1).

Unit - TEMPERTURE UNIT OF MEASUREMENT: When the temperature is measured by temperature probes, this parameter permits definition if the visualisation is expressed as degree Centigrade (°C) or Fahrenheit (°F).

Filt - INPUT DIGITAL FILTER: This permits programming of the constant of time of the software filter referring to the measured input value (in sec.) in order to reduce noise sensitivity (increasing the time of reading).

OFSt - MEASURING OFFSET: Positive or negative Offset which is added to the value measured by the probe.

rot - ROTATION OF THE MEASURING STRAIGHT LINE: In this way the offset programmed on par. "OFSt" is not constant for all measurements. By programming "rot"=1.000, the value "OFSt" is simply added to the value read by the probe before visualisation and it remains constant for all the measurements. If instead one does not want the programmed offset to be constant for all the measurements, it is possible to carry out calibration on two desired

In this case, to define the values to be programmed on par. "OFSt" and "rot", it is necessary to enforce the following formulae:

"rot" = (D2-D1) / (M2-M1)"OFSt" = D2 - ("rot" \times M2) where: M1 =measured value 1; D1 = visualisation value when the instrument measures M1

M2 =measured value. 2; D2 = visualisation value when the instrument measures M2

It then follows that the instrument will visualise : DV = MV x "rot" + "OFSt"

where: DV = visualised value; MV= measured value

InE - "OPE" FUNCTIONING IN CASE OF MEASUREMENT ERROR: This defines the error conditions of the input allowing the instrument to give the power programmed on par. "OPE" as output. The possibilities are:

breakage

probe breakage

OPE - OUTPUT POWER IN CASE OF MEASUREMENT ERROR: SP2 - SET POINT 2: Value of the Set Point n. 2 (it appears if "nSP" This permits setting of the power that the instrument has to give as output in case of measurement error. For the ON/OFF regulators the power is calculated considering a cycle time equal to 20 sec.

diF - DIGITAL INPUTS FUNCTION: it permits to select the digital

= noF: no function

= Aac : Closing the contact connected to the digital input 1 it is

= ASi :Closing the contact connected to the digital input 1 it is possible to acknowledge an active alarm (see par. 4.10.1)

GROUP " InP" (PARAMETERS RELATIVE TO THE INPUTS): = HoLd :Closing the contact connected to the digital input 1 there is These permit the definition of visualization modes of the the hold of the measure in that instant (P.A.: not the reading on the display, therefore the indication could settle with a proportional SEnS - PROBE TYPE: Depending on model, it permits to select delay to the filter of measure). With the function hold the instrument operate the control in base to the memorized measure.

- thermocouples: J (J), K (CrAL), S (S) or TECNOLOGIC infrared Reopening the contact the instrument come back to the normal acquisition of the measure.

> = OFF :Closing the contact connected to the digital input 1 it is possible to select the OFF control (OFF).

= CHSP :Closing and opening the contact connected to the digital - normalized signals in tension: 0..50 mV (0.50), 0..60 mV (0.60), input 1 it is possible to select one of the 4 pre-programmed Set contact is select as active the set point SP1. This function is and the alarm will be activated only after this time has elapsed. possible only when "nSP" = 2, and when is selected it disables the ALARM LATCH:: selection of the active set through the parameter "SPAt" and + 0 = ALARM NOT LATCHED: The alarm remains active in alarm through the key U.

memorized set points.

DIG IN1	DIG IN2	SET POINT
off	off	SP1
on	off	SP2
off	on	SP3
on	on	SP4

when this function is selected it disables the selection of the active set through the parameter "SPAt" and through the key U.

= HE.Co : Closing the contact connected to the digital input 1 it is high alarms. possible to select as active the set point SP2 in "CooL" mode. Reopening the contact is select as active the set point SP1 in "HEAt" mode. This function is possible only when "nSP" = 2.

GROUP "1 Out" (PARAMETERS RELATIVE TO THE OUTPUTS): They permit to program the outputs functioning.

functioning of output OUT 1 as: control output 1 (1.rEG), control relative to alarm AL1 threshold which defines the deactivation value output 2 (2.rEG), alarm output as normally open (ALno), output of alarm AL1. alarm normally closed (ALnc), output alarm normally closed with led AL1d - ACTIVATION DELAY OF ALARM AL1: This permits reverse indication (ALni), output not used (OFF).

O2F - FUNCTIONING OF OUTPUT OUT 2: Similar to "O1F" but par. "Ab1" is activated. referring to output OUT2.

O3F - FUNCTIONING OF OUTPUT OUT 3: Similar to "O1F" but referring to output OUT3.

O4F - FUNCTIONING OF OUTPUT OUT 4: Similar to "O1F" but GROUP " AL2" (PARAMETERS RELATIVE TO ALARM AL2): referring to output OUT4.

GROUP " 1AL1" (PARAMETERS RELATIVE TO ALARM AL1): These permit setting of the process alarm AL1 function.

OAL1 - OUTPUT WHERE ALARM AL1 IS ADDRESSED: It defines to which output the alarm AL1 has to be addressed.

AL1t - ALARM AL1 TYPE: permits the choice of behaviour for alarm A1, by 6 different selections:

= LoAb - ABSOLUTE LOW ALARM : The alarm is activated when the process value goes below the alarm threshold set on parameter "AL1".

= HiAb - ABSOLUTE HIGH ALARM: The alarm is activated when AL2. the process value goes above the alarm threshold set on parameter AL2H - HIGH ALARM AL2 : Similar to "AL1H" but referring to alarm "AL1".

the process value goes below the alarm threshold set on parameter to alarm AL2. "AL1L" or goes higher than alarm set on parameter "AL1H".

= LodE – DEVIATION LOW ALARM: The alarm is activated when referring to alarm AL2. the process value goes below the value [SP + AL1]

= HidE - DEVIATION HIGH ALARM: The alarm is activated when ERROR: Similar to "AL1i" but referring to alarm AL2. the process value goes above the value [SP + AL1]

the process value goes below the value [SP + AL1L] or goes above These permit the setting of the process alarm AL3. the value [SP + AL1H]

Ab1 - ALARM AL1 FUNCTION: This permits definition of alarm AL1 on which output the alarm AL3 has to be addressed. functions, by entering a number between 0 and 15. The number to AL3t - ALARM AL3 TYPE: Similar to "AL1t" but referring to alarm be programmed, that corresponds to the desired function, is AL3. obtained adding the values reported in the following description: **ALARM BEHAVIOUR AT SWITCH ON:**

+0 = NORMAL BEHAVIOUR: The alarm is always activated when there are alarm conditions.

+1 = ALARM NOT ACTIVATED AT SWITCH ON: If, at switch on, the instrument is in alarm condition, the alarm is not activated. It will AL3. be activated only when the process value goes beyond and then returns to alarm conditions.

when the alarm condition occurs.

= SP1.2 : Closing the contact connected to the digital input 1 it is +2 = ALARM DELAYED: When the alarm condition occurs, delay possible to select as active the set point SP2. Reopening the counting starts as programmed on par. "ALnd" (expressed in sec.)

conditions only.

= SP1.4 : The following combination of the connected contacts to + 4 = ALARM LATCHED: The alarm is active in alarm conditions the two digital entries allows the activation of one of the 4 and remains active even if these conditions no longer exist, until the correctly programmed key "U" ("USrb"=Aac) has been pushed **ALARM AKNOWLEDGEMENT:**

> + 0 = ALARM NOT AKNOWLEDGED: The alarm remains always active in alarm conditions.

> + 8 = ALARM AKNOWLEDGED: The alarm is active in alarm conditions and can be deactivated through key "U" if properly programmed ("USrb"=ASi), also if alarm conditions still exist.

> AL1 - ALARM AL1 THRESHOLD : Alarm AL1 threshold for low and

AL1L - LOW ALARM AL1 : Alarm AL1 low threshold when the alarm is a band type or minimum set of AL1 alarm threshold when the alarm is low or high type.

AL1H - HIGH ALARM AL1: Alarm AL1 high threshold when the alarm is a band type or maximum set of AL1 alarm threshold when the alarm is low or high type.

O1F - FUNCTIONING OF OUTPUT OUT 1: This defines the HAL1 - ALARM AL1 HYSTERESIS: Asymmetrical semi-band

definition of alarm delay activation AL1 when the delay function on

AL1i - ALARM AL1 ACTIVATION IN CASE OF MEASUREMENT ERROR: This permits a definition of measurement error conditions. i.e whether the alarm has to be active ("yES") or not ("no").

These permit the setting of the process alarm AL2 functions.

OAL2 - OUTPUT WHERE ALARM AL2 IS ADDRESSED: this defines on which output the alarm AL2 has to be addressed.

AL2t - ALARM AL2 TYPE: Similar to "AL1t" but referring to alarm Al 2.

Ab2 - ALARM AL2 FUNCTIONING: Similar to "Ab1t" but referring to alarm AL2.

AL2 - ALARM AL2 THRESHOLD : Similar to "AL1" but referring to alarm AL2.

AL2L - LOW ALARM AL2 : Similar to "AL1L" but referring to alarm

AL2.

= LHAb - ABSOLUTE BAND ALARM: The alarm is activated when HAL2 - ALARM AL2 HYSTERESIS: Similar to "HAL1" but referring

AL2d - ACTIVATION DELAY OF ALARM AL2: Similar to "AL1d" but

AL2i - ALARM AL2 ACTIVATION IN CASE OF MEASUREMENT

= LHdE - DEVIATION BAND ALARM: The alarm is activated when GROUP " JAL3" (PARAMETERS RELATIVE TO ALARM AL3):

OAL3 - OUTPUT WHERE ALARM AL3 IS ADDRESSED: It defines

Ab3 - ALARM AL3 FUNCTIONING: Similar to "Ab1t" but referring to alarm AL3.

AL3- ALARM AL3 THRESHOLD: Similar to "AL1" but referring to alarm AL3.

AL3L - LOW ALARM AL3: Similar to "AL1L" but referring to alarm

AL3H - HIGH ALARM AL3 : Similar to "AL1H" but referring to alarm AL3.

+0 = ALARM NOT DELAYED: The alarm is immediately activated to alarm AL3 HYSTERESIS: Similar to "HAL1" but referring to alarm AL3.

> AL3d - ACTIVATION DELAY OF ALARM AL3: Similar to "AL1d" but referring to alarm AL3.

AL3i - ALARM AL3 ACTIVATION IN CASE OF MEASUREMENT der - DERIVATIVE TIME: : Derivative time to be programmed in the ERROR: Similar to "AL1i" but referring to alarm AL3.

Loop Break alarm (control loop interruption), which intervenes parameter reduces the overshoot while a high value increase it. when, for any reason (short-circuit of a thermocouple, load tcr1 - CYCLE TIME OF OUTPUT 1rEG: Cycle time of output 1rEG interruption, etc) the control loop is interrupted.

has to be addressed.

LbAt - TIME NECESSARY TO ACTIVATE THE LOOP BREAK Heating) in case of PID double action control. ALARM: Delay time to the intervention of the Loop Break alarm. tcr2 - CYCLE TIME OF OUTPUT 2rEG: Cycle time of output 2rEG The alarm intervenes when the output power remains at 100% for with PID double action control mode, expressed in sec.. the time programmed on this parameter (in sec.)

this contains the parameters relative to control functions.

possible control modes offered by the instrument : PID (Pid), ON/OFF with asymmetrical hysteresis (On.FA), symmetrical hysteresis (On.FS), Neutral Zone ON/OFF (nr).

decide whether the control output 1rEG has to carry out a reverse cycle (functions available for all the control types) action, as for example a Heating process ("HEAt") or a direct action, SLor - GRADIENT OF RISE RAMP: Gradient of rise ramp to be as for example a Cooling process ("CooL")

HSEt -ON/OFF CONTROL HYSTERESIS: Semi-band relative to Point, expressed in unit/minute. the Set Point which defines the activation and deactivation values of Programming the parameter = InF the ramp is not active. the control output/s in case of ON/OFF control (On.FA, On.FS, nr). dur.t - DWELL TIME: Dwell time of the Set Point SP1 before the CPdt - COMPRESSOR PROTECTION DELAY TIME: The delay automatic switching to SP2 (expressed in hrs. and min.) time is counted starting from the last 2rEG output switch off, when Using this parameter, once the first Set (SP1) has been reached, it it's used as Neutral zone control mode, during which the output is is possible to have automatic switching to the second Set (SP2) kept in off state. The output will be switched on when the after a programmable time, thus obtaining a simple thermal cycle. temperature regulator requires it at this time is elapsed. The function Programming the parameter = InF the function is not active. in deactivated programming "CPdt" = OFF.

to decide how Auto-tuning has to be carried out. The possible selections are:

- = 1 if auto-tuning is desired automatically, each time the Parameters relative to the Soft-Start function, which allows =CooL) than [SP+ |SP/2|].
- = 2 if auto-tuning is desired automatically, the next time the St.P SOFT START POWER: If parameter "SSt" is programmed lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" =CooL) than [SP+ |SP/2|], and once the tuning is finished, the par. Practically speaking, the instrument works in manual condition and "Auto" is automatically swapped to the OFF state
- = 3 if manual auto-tuning is desired, by selecting par. "tunE" in If instead par. "St.P" = OFF and a value is set on par. "SSt" at the main menu or by correctly programming key "U" as "USrb" = switch on, the power calculated by the PID controller is divided by from the Set Point because, in order to feature the Auto-tuning the power calculated by the PID controller. FAST with its best performances , it is preferable to respect this SSt - SOFT START TIME (for PID control only): Duration time in condition.
- = 4 if it's desired to activate the autotuning automatically at the To disable the Soft-Start function set par. "SSt" = OFF. end of programmed Soft-Start cycle. The Autotuning will start at the condition that the process value is lower (with "Func" =HEAt) than GROUP " PAn" (PARAMETERS RELATIVE TO THE USER [SP-|SP/2|] or higher (with "Func" =CooL) than [SP+|SP/2|]. = OFF - Autotuning disabled.

When it's occurring an Autotuning cycle, led AT blinks.

SELF – SELF-TUNING ENABLE: Parameter used to enable (yES) or disable (no) the Self-tuning function. Once the function has been enabled, the Self-tuning has to be started by selecting item "tunE", in the main menu, or through key U properly programmed ("USrb" = = tunE : Pushing the key for 1 sec. at least, it is possible to tunE). When the Self-tuning function is active, led AT is permanently activate/deactivate the Auto-tuning or the Self-tuning lit, and all the PID parameters ("Pb", "Int", "dEr", ecc.) are no longer visualised.

 ${f Pb}$ - PROPORTIONAL BAND: Width of the band around the Set ${f Versa.}$ Point within which the proportional control is performed.

Int - INTEGRAL TIME: Integral time to be programmed in the PID algorithm, expressed in sec.

PID algorithm, expressed in sec.

FuOc - FUZZY OVERSHOOT CONTROL: Parameter that permits GROUP "LbA" (PARAMETERS RELATIVE TO THE LOOP the elimination of the variable over-shoots at the start up of the BREAK ALARM): this contains the parameters relative to the process or at the changing of the Set Point. A low value of this

with PID control mode, expressed in sec..

OLbA - OUTPUT WHERE THE LOOP BREAK ALARM IS Prat - POWER RATIO 2rEG / 1rEG : Parameter where it is possible ADDRESSED: This defines to which output the LOOP BREAK alarm to program the power ratio between the element controlled by output 2rEG (ex.Cooling) and the element controlled by output 1rEG (ex.

rS - MANUAL RESET: Power Offset added to the power increase of the proportional term, in order to eliminate the error when it is not GROUP " 1rEG" (PARAMETERS RELATIVE TO THE CONTROL): present the integral value. This parameter is only visualised when "Int" =0.

Cont - CONTROL TYPE: This permits selection of one of the Parameters relative to the ramps, allowing the Set Point to be reached in a predetermined time.

ON/OFF with Furthermore, once the first Set (SP1) has been reached, it is possible to have automatic switching to the second Set (SP2) Func - FUNCTIONING MODE OUTPUT 1rEG: this permits one to after a programmable time, thus obtaining a simple thermal

carried out when the process value is lower than the active Set

SLoF - GRADIENT OF FALL RAMP: Gradient of fall ramp to be Auto - AUTO-TUNING FAST ENABLE: this parameter allows one carried out when the process value is higher than the active Set Point, expressed in unit/minute.

Programming the parameter = InF the ramp is not active.

instrument is switched on, on the condition that the process value is limitation of control power, when the instrument is switched lower (with "Func" =HEAt) than [SP- |SP/2|] or higher (with "Func" on, for a predetermined time. This function is only available for PID control.

instrument is switched on, on the condition that the process value is with a value other than OFF, this is the power given as output at the instrument switch on, for the time "SSt".

switches to automatic control at the elapsing of time "SSt".

tunE. In this case the auto-tuning starts without any control on the the time "SSt", in order to calculate a ramp. The output power starts process value condition. It is recommended to use this option, from 0 and is progressively increased, according to the calculated starting the auto-tuning when the process value is as far as possible ramp, until the time "SSt" is reached or until the power overcomes

hours and min. of the Soft-Start described on pa. "St.P".

INTERFACE): This contains the parameters relative to the key U and display functions.

Usrb - KEY U FUNCTION: Decides which function is associated to key U. The possible selections are:

= noF: no function

= OPLO: Pushing the key for 1 sec. at least, it is possible to swap from the automatic control (rEG) to the manual one (OPLO) and vice

= Aac : Pushing the key for 1 sec. at least, it is possible to acknowledge the alarm.

= ASi: Pushing the key for 1 sec. at least, it is possible to acknowledge an active alarm

= CHSP : Pushing the key for 1 sec. at least, it is possible to select one of the 4 pre-programmed Set Points on rotation.

= OFF: Pushing the key for 1 sec. at least, it is possible to swap from the automatic control (rEG) to the OFF control (OFF) and vice

diSP - VARIABLE VISUALISED ON THE DISPLAY SV: Parameter 6.3 - GUARANTEE AND REPAIRS trough which it's possible to decide what is visualised on the display The instrument is under warranty against manufacturing flaws or SV: the active Set Point (= SP.F), the Set Point active when there faulty material, that are found within 12 months from delivery date. are ramps (= SP.o), the control power (= Pou), the alarm thresholds The guarantee is limited to repairs or to the replacement of the AL1, 2 or 3 (= AL1, AL2 or AL3) or it can be switched off (OFF).

Edit - FAST PROGRAMMING OF ACTIVE SET POINT AND The eventual opening of the housing, the violation of the instrument by the fast procedure. The parameter can be programmed as:

=SE: The active Set Point can be modified while the alarm In the event of a faulty instrument, either within the period of thresholds cannot be modified

thresholds can be modified

modified

=SAnE: If the active Set Point or the alarm thresholds cannot be Tecnologic, except in the event of alternative agreements. modified

GROUP " 'SEr" (PARAMETERS RELATIVE TO THE SERIAL COMMUNICATION): If the instrument is equipped with RS485 7.1 - ELECTRICAL DATA serial communication these parameters allow device configura- Power supply: 12 VAC/VDC +/- 10% tion for communication.

Add STATION ADDRESS IN CASE OF COMMUNICATION: This is used to set the instrument address in Input/s: 1 input for temperature probes: tc J,K,S; infrared sensors the communication net. Programme a different number for each TECNOLOGIC IRS J e K; RTD Pt 100 IEC; PTC KTY 81-121 (990 station, from 1 to 255.

transmission speed of the network to which the instrument is V, 0/1...5 V, 0/2...10 V. 2 digital inputs for free voltage contacts. connected. The possible selections are 1200, 2400, 9600, 19.2 (19200), 38.4 (38400).

All stations must have the same transmission speed.

Programming access. If programmed as "LoCL" this means that the 10VDC) instrument can only be programmed from the keyboard, if Auxiliary supply output: 12 VDC / 20 mA Max. programmed as "LorE" it can be programmed from both the Electrical life for relay outputs: 100000 operat. keyboards and serial line.

6 - PROBLEMS, MAINTENANCE AND GUARANTEE

6.1 - ERROR SIGNALLING

Error	Reason	Action
	Probe interrupted	Verify the correct
uuuu	The measured variable is under the probe's limits (under-range)	connection between probe and instrument and then verify the correct
0000	The measured variable is over the probe's limits (over-range)	functioning of the probe
ErAt	Auto-tuning not possible because the process value is higher (with "Func" =HEAt) than [SP- SP/2] or lower (with "Func" =CooL) than [SP+ SP/2].	Swap the instrument to OFF control (OFF) and then to automatic control (rEG) in order to make the error message disappear. Once the error has been found, try to repeat the auto-tuning.
noAt	Auto-tuning not finished within 12 hours	Check the functioning of probe and actuator and try to repeat the auto-tuning.
LbA	Loop control interrupted (Loop break alarm)	Check the working of probe and actuator and swap the instrument to (rEG) control
ErEP	Possible anomaly of the EEPROM memory	Push key "P"

In error conditions, the instrument provides an output power as programmed on par "OPE" and activates the desired alarms, if the relative parameters "ALni" have been programmed = yES.

6.2 - CLEANING

We recommend cleaning of the instrument with a slightly wet cloth using water and not abrasive cleaners or solvents which may damage the instrument.

instrument.

ALARMS: This decides which are the Sets that can be programmed or the improper use and installation of the product will bring about the immediate withdrawal of the warranty's effects.

warranty, or further to its expiry, please contact our sales =AE :The active Set Point cannot be modified while the alarm department to obtain authorisation for sending the instrument to our company.

=SAE: If the active Set Point or the alarm thresholds can be The faulty product must be shipped to TECNOLOGIC with a detailed description of the faults found, without any fees or charge for
